Yes, it's the Hamtronics converter. I have good experience with other
Hamtronics kits, so it should be a good design.

I have a technical question that might be a bit outside this news group. However, I have tried to get hold of information on PSK demodulators or modems. Just to recap, PSK is phase shift keying. On commercial transmissions, QPSK and BPSK is common for digital communication. I assume Bi Phase Shift Keying is the same method that is used on amateur satellites, where the RF carrier is shifted 180 degrees between a low and a high bit. After being downconverted to 28 MHz and demoded on a SSB receiver, you should end up with a Audio Phase Shift Keyed signal (?), let say centered around 2 kHz. Now, making a PLL circuit to detect the phase change could be done by using a simple chip as NE 565. Then the two states could be converted to normal AFSK packet (1200 bps only) using the NE 566. However, I have one question. What determines what the PSK VCO locks to. Is there a "long" low or high bit that locks the VCO in phase to set the low or high bit state. When is the signal in phase and when is it 180 degrees out of phase? Or does the software take care of this? There are chips, QPSK and BPSK demodulator chips, that can demod RF carriers up to 1 GHz directly. Demoding a 2 kHz PSK tone should be very easy. However, I have the 1993 ARRL hand book and I get the Amateur 73 magazine, but there seem to be some magic involved when talking about PSK, why? I have never seen a PSK circuit design or a technical description of the PSK modulation system. This information must be available someplace. Please drop me a note via E-mail, or make an open response. Digital PSK is the wave of the future.

5. Re: RS-15 Anyone Worked It??

Newsgroup: rec.radio.amateur.space
Date: 1995-01-01 14:45:16 UTC
From: mbarts@vt.edu
Message-ID: <mbarts.18.000EC199@vt.edu>
Source record: 26160

I've managed to squeek out two SSB QSOs on RS-15 so far. My downlink is considerably weaker than on RS-10, not surprising given the difference in altitudes of the two birds. I notice that RS-15 seems noisier than RS-10. Is that just local conditions or has anyone else noticed that as well? I've heard rumors that guys are working Europe on RS-15 but only DX I've heard so far is a cw station signing /YV5. Of course, I couldn't work him. Anybody else having any luck with this bird?

Mike KB4NT

> 7.2Mhz. These are all music or TV sound however.
>

My source of information is "Satellite Radio" by Thomas P. HArrington. I
got it from Universal Electronics in Columbus Ohio. I verified the
satellite, transponder, and frequency in their monthly guide and they
seem to think it's correct. The satellite receiver output must be
unclamped baseband video output (0 - 13MHz) Dump that to a general
coverage receiver (wider band enable helps) and should have it. I can't
say I've tried this (I'm using a 1.7 gig Yagi and downconverter) but I'd
like to know if you have any success. - Chris

Message-ID: <1995Jan1.170112.9997@news.vanderbilt.edu>
Source record: 26156

Hi,

Just a brief note that the popular Trakbox, used for tracking
satellites, has a bug in the firmware which causes it to crash
when it tries to track using 1994 keps in 1995. Keps with a
1995 epoch should solve the problem, at least for another year.

>
>Yes, it's the Hamtronics converter. I have good experience with other
>Hamtronics kits, so it should be a good design.

Alas, not necessarily. I love their helical filtered preamp, but the converter was a dog. I could get the oscillator to start reliably, or be spur free, but not both at the same time with the supplied components. The NF was also nothing to write home about. I think you'll be better off just scratch building a converter. Try Reisert's common base oscillator design (Ham Radio, March 84). By the time you get the Hamtronics to work right, if you do, you'll have done more work than if you started with a clean sheet. Build it "ugly" style on an unetched piece of copperclad.

Disclaimer: Sample of one and all that, but I do have a good test bench, and somewhat of a clue. Their oscillator design is very sensitive to the particular crystal's activity. I don't like that in a design expected to be built by someone without a well equipped test bench. You might be lucky and get a hot crystal, but then again you might get one worse than mine. The Reisert circuit will start them all, and cleanly too.

10. re: RS-15 KEPS

Newsgroup: rec.radio.amateur.space
Date: 1995-01-01 18:41:46 UTC
From: durham@lobby.ti.com
Message-ID: <3e6t1a$874@superb.csc.ti.com>
Source record: 26158

RS-15 is alive, but the KEPS don't agree with the correct AOS and LOS observed. I heard it when it was supposed to be on the other side of the world. When it is supposed to be overhead, there is no signal! I have downloaded from several sources which all seem to agree on the wrong location. The tracking program (Instantrack) is working OK for the other satellites, so there must be some kind of flaw in NORAD observation or reporting. Hope someone involved in the generation of this data notices soon.

12. Worked RS-15?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-02 10:51:15 UTC
From: ken@sislnews.csc.ti.com
Message-ID: <950102105115@ken_durham.linear.sc.ti.com>
Source record: 25963

Posted this earlier, but it seems to be deleted...

Mike, I have heard RS-15, but not worked it because the KEPS don't work
for me. They show the satellite on the other side of the earth when it
can be heard overhead. This makes it hard to aim the beams!
Do you or anyone else have working KEPS? I got mine from several sources
and all seem to agree, but none work for me.

Ken K5MBV durham@lobby.ti.com

13. RS-15 Anyone Worked It?? YES

Newsgroup: rec.radio.amateur.space
Date: 1995-01-02 15:24:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A0D1F8.14E60000AE.uuout@freddy.supernet.ab.ca>
Source record: 25962

Hi Bruce,
Yes, I have worked RS-15. I have worked approx. 37 stations on
this bird. Things to think about are as you stated, overlap with RS-10
since it is on the same passband, as well as a weaker downlink at the
moment. Power on the downlink seems low...in a chat with Red K4HVK, he
stated that there was a problem with the downlink power (only about .5
watts or so, not the 5 watts we expected, with the beacon at 1.2 watts)
is being worked on.

So you may find it a little hard to work at first and if they
can fix this problem you should have good success. Please note that if
you listen to the beacon you'll be able to hear which bird your actually
on (if you can copy cw).

I'm using about 25 watts into 2 X 20 element cross yagis on the
uplink with a rs 5 by 3 reports on the downlink. Receive antenna is a
dipole (rotatable). This seems to work and I'll leave it up to you as
far as the element set that you wish to use (about 8 sets out there).

Good luck with RS-15
73 de Ernie VE6LU (ernie.koch@freddy.supernet.ab.ca)

14. Suggested RS-15 element set

Newsgroup: rec.radio.amateur.space
Date: 1995-01-02 16:24:15 UTC
From: wallio@dsm1.dsmnet.com
Message-ID: <3e99bf$3g@dsm6.dsmnet.com>
Source record: 25964

The following is offered to suggest an accurate RS-15 element set:

Launch event 94085 has resulted in element sets being released for two objects, 94085A (23439) and 94085B (23440). One of these objects is the payload (RS-15) and the other is probably the spent launch vehicle.

It is not unusual for the big guys to confuse one object for the other right after a launch and separation event. The situation is compounded by skeleton staffing of required analysts during the holidays. Note that we have not received new element sets since day 362 (we would normally expect almost daily updates).

The two latest available relevant element sets are as follows:

1 23439U 94085A 94362.60621975 -.00000042 00000-0 00000 0 0 107
2 23439 64.7982 170.9390 0224393 305.3126 52.6969 11.19236697 283

1 23440U 94085B 94361.79150546 -.00000043 00000-0 00000 0 0 10
2 23440 64.8297 172.1572 0188748 292.0126 66.1014 11.27113018 197

Comparing tracking program AOS, TCA and LOS predictions based on these two element sets with logged observations can resolve the confusion.

The (probably) spent launch vehicle is 23439. RS-15 (riding on the larger payload) is 23440.

Good hunting.

From: Rolf Mathison <rolf_mathison@hpatc1.desk.hp.com>
Message-ID: <3e9arp$spv@hpuerci.atl.hp.com>
Source record: 25965

Lately, I've been hearing what sounds like a 105 bps "metronome"
all across the range of 132 - 139 Mhz. Is this a local interferenc
(I'm in northern NJ) or has anyone else picked it up? I'd be
curious to know the source...Any ideas?

Regards.

16. RS-15 KEPS is 23440

Newsgroup: rec.radio.amateur.space
Date: 1995-01-02 21:04:55 UTC
From: durham@lobby.ti.com
Message-ID: <3e9ppn$kmu@superb.csc.ti.com>
Source record: 25966

Thanks for the info guys. 23440 worked fine for AOS and LOS for RS-15.

RS-15 puts out a decent beacon signal, but the transponder doesn't
compare well with RS-10/11. Could hear myself briefly with 170W and 11 el.
This on a high pass. Heard a few incomplete QSO's and they were weak.

23439 is not the correct designator for this satellite.

Ken K5MBV durham@lobby.ti.com

17. Re: TrakBox died at midnight!

Newsgroup: rec.radio.amateur.space
Date: 1995-01-03 00:32:42 UTC
From: BIDDLEAP@ctrvax.Vanderbilt.Edu
Message-ID: <1995Jan3.003242.24945@news.vanderbilt.edu>
Source record: 25967

Well,

As the result of a lot of work by many people,
it turns out that the TrakBox
can be conned into working by at least two tricks.

1. Set the date in the RT clock in the TB as if December has
more than 31 days. i.e. January 2 becomes 1994/12/33.

2. Set the date in the RT clock in the TB as if 1994 has 13
months in it. i.e. January 2 becomes 1994/13/2.

I am using the first, and the second is reported also to work.
It seems that two bugs/features cancel out here.

Thanks to all who worked this out in a few hours!

-> on RS-15 but only DX I've heard so far is a cw station signing /YV5.
-> Of course, I couldn't work him. Anybody else having any luck with
-> this bird?

I had spoken to Red K4HVK and he had said that the control station was
still working on a problem with the attenuator. Apparently the beacon
is about 1.2 watts (normal) but the power output of the transponder is
not very good (approx. .5 watts). It should be putting out about 5
watts.

So we must sit and wait to see what happens in the near future. There
are a lot of stations on the bird so keep trying you'll get that DX yet.

Station here: 2 X 20 elements uplink
Dipole downlink
25 watts

It does work but not to well. Good luck with your DX

73 de Ernie VE6LU

It sounds like you are both getting hit by the dreaded Pager systems.
They have very powerful signals, and although they are above 150 mHz,
they can mix in the front end and come out most anywhere.
The popular term is Intermod.
Sorry to bring the bad news!

From Bill, n7ryw@teleport.com

21. 400 MHz receiving: want to test, what to listen?

Newsgroup: rec.radio.amateur.space

From: brax@ava.hut.fi
Message-ID: <brax.7.2F091ABD@ava.hut.fi>
Source record: 25970

I am building a receiving setup to dump data from a swedish microsatellite called Astrid, due to launch almost any minute now from Plesetsk, Russia. I would like to test my equipment, but I don't have any tables where I could find another satellite already in orbit that would send some signal around 400 MHz, +-20 MHz. (BTW, why can't the beacon frequency be included in the two-line data sets that are so kindly published regularly?) Does somebody know a suitable target?

Some weeks ago I posted a question about the mysterious FB in the preamp I was constructing after the design of Chip Angle. Thanks to those who provided me not only with the answer but also with large amount of most useful side information. The preamp is working fine, I have tested it with a HP network analyser and it shows adequate performance from 250 MHz to 550 MHz, with >12dB of gain and <1dB noise figure at the nominal frequency +-20 MHz. I also constructed a 7-turn axial-mode helix antenna for the station, which turned out to be a success with SWR <1.2 from 380 to 420 MHz and cost <$40. If someone is interested, please feel free to mail or post.

Matti Brax

If it sounded like a rotating drum and was 137MHZ to 138MHZ then it
could have been a download from a NOAA weather satellite.

No it wasn't WEFAX transmission ((I use them all the time...) and
it was across the whole band. Its been suggested that its
intermod from a beeper co.

Rolf

24. RS-15

Newsgroup: rec.radio.amateur.space
Date: 1995-01-03 15:23:10 UTC
From: ROBERTSM@JSC.MIL
Message-ID: <sf092662.025@JSC.MIL>
Source record: 25974

The following is a 2 line element set for RS-15 that results in
predictions within 3 minutes of the AOS/LOS:
RS-15
1 23439U 94085A 94361.17042135 -.00000043 00000-0 0000000 0 81
2 23439U 64.8325 173.1633 0187416 292.2585 65.8559 11.27110522 128
I have noticed that some of the other element sets produce wrong
predictions for RS-15.
I have worked several stations on RS-15. The downlink signal
levels are weaker than RS-10. My son Andy, N3QYA, has worked several
Europeans in the past few days on RS-15.
Good luck and see you on the birds. 73

25. Building portable satellite station

Newsgroup: rec.radio.amateur.space
Date: 1995-01-03 15:38:37 UTC
From: dgf@netcom.com
Message-ID: <dgfD1u64D.I23@netcom.com>
Source record: 25975

I'm starting construction on a portable satellite station for the 70CM->2M satellite modes. I haven't used any of these modes before. For 2M operation I'll be using an ICOM IC-202. For 70CM operation, I'll be using a MIZUHO 6M SSB/CW HT driving a MM 50/432 MHz transverter. Another station will be built for 2M->10M usage, so these questions are specific to the 70CM->2M modes.

The station will be used for Field Day (hopefully FD 1995 if all goes well!).

For the most "sure fire" results, I suspect uplink on 70CM and downlink on 2M is best (due to third-harmonic interference the other way around). Please correct me if I'm wrong.

Question #1: For SSB usage, do I need to accomodate LSB transmit or receive on either 2M or 70CM? I don't know the "conventions" currently in use. Neither rig will do this unmodified.

Question #2: I have to pick 100 kHz of coverage on 70CM (the Mizuho will only do two 50 kHz ranges). What would be the suggested 70CM coverage given this constraint (that is, pick the "best" 100 kHz of the 70CM band)?

BTW I've read a recent FAQ; I'm looking here for advice given some equipment constraints as noted above.

Thanks for any info! Direct e-mail preferred...

Jeffrey,

Nothing is easier than that:

You take the output signal from your FT-5200, attenuate it and feed it to
a FM-receiver. Than you connect the audio to a SSB transmitter and
there you are.

On the receive side it works much the same, so hope to hear you soon
on OSCAR-13 with your FT-5200!

Source record: 25983

My experience has been that the "RS15?" elset in ARLK057, the Keplerian bulletin sent out by the ARRL, works pretty well. The AOS/LOS seems to be off by about 10 minutes on the *early* side. I confirmed those findings with another station here in Mass.
One bulletin I saw suggested that 100 watts ERP would be necessary to work the bird well, and I have to agree with that. Right now my station is capable of about 70 watts ERP. The antenna is an MFJ three element beam that I can point only in azimuth. My best results with RS-15 (and even those aren't all that great) happened with the bird about 30 degrees above the horizon and the beam pointed. Not surpising, but nice confirmation. Once my AOP-1 is back up in the Spring (and thanks to all those who gave me suggestions about fixing the boom slip, but the New England winter hit before I could get the antennas up again) I don't think I'll have any trouble. The pass duration is much longer, maiking pointing easier, and the Doppler is much easier to manage. Bascially, I think that many stations which have performed well for RS-10 are going to have to be upgraded for RS-15. My advice, for what it's worth, is to put the money into antennas and preamps, not amps, if you possibly can.
There was one other comment that RS-15 seems noisier than RS-10. I don't think that's the case. Ten meter noise appears to have increased over the last few days. The last ARRL propagation bulletin did mention a recurring coronal hole that could be stirring things up.
When it comes to concern over "which bird is he on?", I might suggest that we switch from "CQ RS" to "CQ 10" and "CQ 15", or "CQ RS5" or some such. Let's see some discussion on this.
Lastly, it seems that much of the cw work is clumping up down at the very low end of the passband. Let's spread out some. Since there is so little SSB activity, try a little higher, maybe. SSB ops, it's only a suggestion!

I am pleased to see this question and the response that it
has drawn. I was involved in some VLBI Radio Astronomy
back in the 1960's with some eminent Astronomers. It has
since been in my mind that a large apperature synthesised
Radio Telescope could be achieved by taking the signals
from widely distributed receivers recorded in some form to
be decided and processed at a common point by computer
This project would take vast resources and I doubt if it could
be achieved by a professional body. As I see it many
Amateur Short wave listeners and Radio Hams would need
to participate. A special but easily constructed receiver
would need to be designed, the specification yet to be
decided, a timing system would need to be set up to re
synchronise the data. A cheap recording system would
need to be devised, a system with sufficient bandwidth
to leave the data intact or at least recoverable. A network
of people would be required to pass and co-ordinate the
data. The services of a University or other large computing
service would be required, software to perform the various
data manipulations would have to be developed. Submission
of observed data could be by packet, internet, snail mail,
any other means that someone could come up with.
By processing the data in different way the simulated
telescope could be made to sweep or concentrate upon
specific co-ordinates. True international co-operation
would permit continuous observation of the whole sky.
It may transpire that a broad spectrum of frequencies can
be observed. The data received by a single station would
of course be unintelligible as the practical limitations to the
receiver temperature of an amateur station, however as the
signals from many stations are combined the system noise
temperature will reduce dramatically.
The services of professional astronomers and cosmologists
would be required to evaluate the data provided, but the
information should be available for all.

Well hoping others will spot this and chip in their six pennyworth.
Gary Peach

I can confirm this also, but you have to use the keps marked with the "?"
mark, or else you are apparently tracking the booster rocket not the payload!

I have used my 11ele beam with 100W and two ele tri-bander for downlink (both
azimuth rotatable only) with good results on RS-10, but so far poor results
with RS-15.

> The pass duration is much longer, maiking pointing easier, and

The higher orbit and thus longer window sure sounded great, but apparently
there is a problem with the sat's downlink power, and unless they can correct
this the bird may be of limited use with an average ham station.

The band has sounded about the same at this QTH, again I think it may be
the problem with the downlink power.

39. Building portable satellite station

Newsgroup: rec.radio.amateur.space
Date: 1995-01-05 06:54:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A0F59A.14E60000C0.uuout@freddy.supernet.ab.ca>
Source record: 25989

Hi David,
Welcome to the satellites and its very nice to see that you are
undertaking a venture that will enlighten all.

To shed some light on your question;

-> Question #1: For SSB usage, do I need to accomodate LSB transmit or
-> receive on either 2M or 70CM? I don't know the "conventions"
-> currently in use. Neither rig will do this unmodified.

The answer is yes, you will need to be able to transmit LSB on 70cm if
you intend to work AO-10 or AO-13 (mode B) as the birds have
inverting transponders. Also if you get the chance to work FO-20
(mode J) you'll need 2m LSB for transmit and 70cm USB for receive.

-> Question #2: I have to pick 100 kHz of coverage on 70CM (the Mizuho
-> will only do two 50 kHz ranges). What would be the suggested 70CM
-> coverage given this constraint (that is, pick the "best" 100 kHz of
-> the 70CM band)?

Now this will be very hard to figure out because I really don't know
what you want to work....suggestion....have a look in some books on
AO-13, AO-10, FO-20, and the RS birds. If you can split that 100kcs
into two 50kc bands, I would use 435.475 to 435.525 LSB transmit for the
uplink on AO-13 and 435.825 to 435.875 for FO-20 USB receive. Now
please keep in mind that FO-20 and AO-10 may not be useable during this
time. These birds are here today and gone tomorrow, as far as
reliability???

Good luck Dave and C U on the birds

This would not work. SSB needs to be tuned in 10 Hz increments to be
understandable, especially with Doppler. The 5200 tunes in 5000 Hz steps.
A little too coarse.

Maybe you might want to try a radio built for SSB?

<mucho snippo>

There are two systems in widespread use, the Kansas City Tracker and the Track Box. Both are very well supported, and there are others, but I don't recommend them because they use two of your computers' ports, and they are hard enough to come by. The KCT is a finished card for internal PC installation, while the Track Box is a kit that connects to a serial port.

To get the Kansas City Tracker, you can call 609-751-1018
For Track Box information, contact TAPR. I don't have their info in front of me, but I am sure that someone has it here.

Message-ID: <950105142113@ken_durham.linear.sc.ti.com>
Source record: 25999

The problem with getting a decent signal out of the transponder may be due in part to the innacuracy of the Keps. The best I've found have about 30 to 45 second AOS errors. This is a problem for the uplink beam since it results in a significant offpointing error (attenuation.)

I managed to work RS-15 on a high pass by hunting with the 2 meter beam while listening to the output. My signal was as good as RS10/11 on that pass and resulted in 4 contacts.

When we get a good set of Keps and if the transponder power problem is corrected, the satellite should at least give some improved coverage range.

Does anyone have new information on efforts to fix the transponder output power problem?

Ken K5MBV durham@lobby.ti.com

If you have an interest in receiving real-time images from satelites
read on......

Equipment to receive these real-time images are manufactured in Queensland
Australia. This project began life as a research / recreational hobby by
a team of radio enthusists. The final outcome of the project was a system
to receive real-time images from polar orbiting weather satlites.

Images are available from American (NOAA), Russian (METEOR) and Chinese
(FENG-YUN) satelites as they traverse your geographical area. The
satelites transmit both visible light and infra-red images. Resolutions
vary from 2.4Kms to 5Kms per pixel.

The system comprises a simple omni-directional antenna, a suitable radio
receiver, demodulator card (AD converter) and viewing software suitable
for the viewing and manipulating images on IBM PCs.

An overall system price is in the order of $650 (Aust) with the possible
addition of a mast head pre-amp for $30. Various antenna equipment and
cabling is required and can be purchased for around $15. Detailed
diagrams are included for the construction of the antenna.

Please respond in e-mail if you are interested in obtaining more
information. Parts of the system are also available in kit form.

If cost were no object, the technology exists to build a DSP
demodulator to replace the FM demodulator. As I understand
it, programming a DSP chip to interpolate frequencies is
quite do-able.

Rick KK7B, wrote a nice set of articles on phasing receivers
and transmitters. See the January, April, and May 1993 issues
of QST.

RS-15 just came over my location in College Station, TX at a pretty high elevation (around 80 deg). Using keps from orbit 76 for object 23439 and orbit 65 for object 23440, this was my finding. I began receiving the beacon more than 15 minutes into object 23439 being high overhead. This was a few minutes before 23440 was to come into view. At the point 23440 was supposedly overhead, I was already hearing the dopplar dropping. When 23440 was about 6 minutes to LOS, I already lost the beacon. So in conclusion, it appears that with the kep set I have, 23440 more closely matches with what I observed but is still 5 minutes behind.

Why is it so difficult to get reliable keps on this bird? NORAD claims to be able to pin point the location of an incoming ICBM but they can't track a satellite that has been up for over a week.

SB SPACE ARL ARLS001
ARLS001 New satellite planned

New satellite planned

A satellite now being designed in South Africa will include an
extensive Amateur Radio package and is scheduled for launch in
January 1996, according to South African amateur satellite
enthusiasts, as announced in a release from Henry Chamberlain,
ZS1AAZ.

Called Sunsat, the satellite is being designed and built by
engineering students at the Electronic Systems Laboratory at
Stellenbosch University.

In exchange for a US National Aeronautics and Space Administration
launch, Sunsat will carry a precision GPS receiver and a set of
Laser retro-reflectors, for NASA's use.

The Amateur Radio payload was approved at the SA-AMSAT Spacecon 91
Conference. It includes duplicate transmitters and receivers for
the 2-meter and 70-cm bands, a 24-cm (1260 Mhz) receiver and 13-cm
(2400-MHz) receiver. A number of uplink and downlink frequency
combinations are possible.

Sunsat will offer extensive digital communication capability. One
of the 2-meter receivers has four IF sections connected to 1200-baud
AFSK packet modems. The satellite carries three G3RUH-compatible
9600-baud modems that can be switched to various receivers and
transmitters. The designers say that ground-station requirements
are minimal. Data communication between stations running 10 W
transmitters and dipole antennas will be practical. Since large
quantities of data can be stored in the satellite, global data
transfer will be possible.
```

Sunsat carries a number of educational experiments, including a 2-meter ''parrot'' mode repeater intended for amateurs new to satellite operating. Uplinked speech will be digitally stored and retransmitted on the same frequency, enabling school users to hear the retransmission and know that they are getting through.

50. Satellite Tracker

Newsgroup: rec.radio.amateur.space
Date: 1995-01-05 23:13:26 UTC
From: ajbutler@ins.infonet.net
Message-ID: <3ehuem$eg@insosf1.infonet.net>
Source record: 25996

In this newsgroup about a month ago there was a posting telling where to find a program on the Internet to track satellites. If I remember this information properly it was able to keep track of a large number of the satellites at the same time. Also it was able to depict the view of the earth as it would be seen from the satellite. If I am not mistaken this program may have come from Germany.

Can someone tell me where to find this program as I would like to get it and try it out. Also a friend at work without access to the Internet is interested in it.

Thanks for any help that can be provided.

Hello Reinhart,

Just a few notes on your suggestion about moving the cw up high on RS-15. Well I must disagree with this idea. The signals on this bird are already very hard to hear and adding cw on top of ssb signals is not smart!

I've worked over 50 stations on ssb and find that the guys running 100 watts ERP don't know the difference between ERP from the antenna and what comes out of the back of their amps. What I'm saying is not meant to be taken the wrong way, please. I do realize that this bird seems to be a little hard of hearing but those guys running 170 watts to their KLM-22Cs may want to reduce that power a bit (SSB and CW).

The satellite does appear to have a problem, namely the attenuator. I am not 100% sure what it is but have a hunch that it is very finicky about the uplink power levels. I find that when the bird is out west over the Pacific and usage decreases, it starts to sound better (barring that its not over the far east). This would indicate that we have to back down all our power levels to stop the attenuator from being pushed on.

Your comments are welcome, please.

52. [TAPR] TrakBox Update

Newsgroup: rec.radio.amateur.space
Date: 1995-01-06 07:26:56 UTC
From: gjones@tcet.unt.edu
Message-ID: <3eirc0$7im@hermes.unt.edu>
Source record: 26000

TAPR: TrakBox Firmware Update 1/5/95

As most active TrakBox users must know by now, there is a bug in
firmware versions 3.30a through 3.30h. The problem relates to the
the clock settings - now that we are in the year 1995. New code is
available from various sources for the benefit of those users who
have programming capability. The code will be posted on ko-23 and
ko-25 as soon as the birds are back in normal service. You can
also find the code in DL5 of the Hamnet SIG on Compuserve. We
expect it will become available in many more places after that as
users spread the word.

Thanks to Sueo Asato, JA6FTL, for providing version 3.30i so quickly.

For the benefit of users not having programming capability, TAPR will
start taking orders starting on Friday, Jan 6th. New ROMS will cost
$12 + $2 for US Shipping/Handling. Shipping will start when the office
resumes normal operations on Tuesday, Jan 10th, 1995.

If you received a TrakBox from TAPR after Nov 1, 1994, then contact the
office about the procedure to get your EPROM replaced.

Jack Davis, WA4EJR - TAPR TrakBox Manager

Tucson Amateur Packet Radio
8987-309 E Tanque Verde Rd #337 * Tucson, Az * 85749-9399
Voice: 817-383-0000
Fax: (817) 566-2544

NOTE: The TAPR Office opens full-time again on Tuesday, Jan 10th.
The office has been taking orders by fax and voice mail during the
holiday break.

53. SatTrack for LINUX

>
> Please, can anyone tell me, on what ftp-server I can find a nice satellite-
> tracking program like Quiktrak, InstantTrack or PCTrack (all DOS), for
> os LINUX ?
> Many thanks for your answer.
> regards
> Hendrik Jassies.

Bob Kupiec was kind enough to provide an FTP site from which SatTrack V2.0
can be obtained. Do the following:

ftp ftp.jvnc.net (128.121.50.2)
login anonymous
binary (this line is important!)
cd /pub/priv/kupiec/sattrack
get sattrack.V2.0.tar.Z

Place this file into your Unix home directory, uncompress it, and then type
'tar xvpf sattrack.V2.0.tar'. This will unbundle the distribution file
and will create all necessary sub-directories. Then look into the documentation
file 'sattrack.doc' in SatTrack/doc for instructions how to compile sattrack
(and some other auxiliary programs). It should compile perfectly on at least
Sun-3's (SunOS 4.0.3), SPARCstation IPCs (SunOS 4.1.1) and i386 laptops
running Linux. Make sure the compiler and linker flags in the Makefile
are configured properly!

Future releases are expected to feature the SDP4 model for satellites with a
period of more than 225 minutes and X Window graphics with a color world map
tracking chart (V3.0).

Version 2.2 is an improved version of V2.0 and will be ready for release
very soon. Stay tuned ...

Please let me know how the installation went and if you encountered any
problems, bugs or imperfections.

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

SimTel/msdos/hamradio/
sat03nov.zip Fast Satellite Tracker by DL3HRT & DL3HZM

This program allows to track up to 700 satellites. The tracking is done
eigther in real-time or in the delta-t mode. 16 satellites are presented
simultaneously in the real time table.

Features:
* up to 700 different satellites
* using AMSAT and NASA format
* optional calculation of AOS (Appearance Of Satellite) and maximum
elevation
* optional acustic signal triggered by AOS/LOS
* prediction protocol to textfile
* prediction also for two sites
* select the second observer from up to 2000 locations
* locator-coordinate-distance computation
* worldmap with spotlight
* azimuth-/elevation graphic with optional presentation of horizon
* information system for particular satellites
* bi-lingual (English and German)
* all data files are text-type files
* selecticve update of element sets when using NASA format
* display of the sun terminator

Minimum configuration:
* PC-AT 286 and above
* abt. 200kByte disc capacity
* abt. 400kByte free memory when using graphics
* EGA/VGA-graphic

Optional:
* Arithmeticprocessor
* Mouse

sat03nov.zip has replaced sat04aug.zip.

56. PSK Modem Description in QEX

Newsgroup: rec.radio.amateur.space
Date: 1995-01-06 15:54:46 UTC
From: magliaco@pilot.njin.net
Message-ID: <3ejp46$6s2@pilot.njin.net>
Source record: 26005

In response to the recent questions regarding PSK modulation and Pacsat operations, I would like to make reference to an article I wrote in the August 1994 issue of QEX that describes a Pacsat Modem I designed and built for digital satellite communications.

The article not only describes BPSK, but also how it is handled by the modem circuitry, and its interconnections with a TNC, and is my attempt at clearing the confusion and lack of information on this subject.

Copies of the August 1994 issue of QEX can be obtained by writing:

Maty Weinberg
American Radio Reley League
225 Main Street
Newington, CT 06111

Expect a small "bill" along with the issue to cover its cost.

Good luck!

57. PSK Modems

Newsgroup: rec.radio.amateur.space
Date: 1995-01-06 16:11:33 UTC
From: ken@sislnews.csc.ti.com
Message-ID: <950106161133@ken_durham.linear.sc.ti.com>
Source record: 26008

Aside from the technical aspect of satellite packet, is there a source of information about commercial TNCs and modems? Like is there anyone other than PacCom building completely assembled packet interfaces for satellite use up to 9600 baud? Can a PSK TNC/Modem be bought for less than $200?

I don't want to build or assemble any more kits in the near future, but would like to try packet through the microsats in order to get ready for the big new bird and for Sunsat.

Could a 16 bit PC sound card do all of the packet functions? It works for me for 1200 baud reception with an 8 bit card.

* NOAA-14 LAUNCHED! *
====================
NOAA -J (NOAA 14) was successfully launched on Friday 30-Dec-94 at
02:02 PST from Vandenberg AFB atop an Atlas-E booster. The burn was
nominal for a 870 km near polar orbit inclined 98 degrees.

Dallas Remote Imaging Group member Richard Allen, W5SXD, of Houston, Texas
provided the following report on NOAA-14:

The 1800Z pass of NOAA-14 was heard in Houston. The beacon on 137.770 MHz
was heard well and my HRPT system locked on at 1698.0 MHz for the first
half of the pass. It appears that the element set that I posted earlier
is very good. I manually rocked my antenna around the computer generated
position and the signal level dropped in all directions. I got carrier
lock and bit-sync but no frame sync. This is what I usually see when
NOAA-10 is transmitting LAC downlinks. I did not try to observe the eye
pattern but I'll do that on the next orbit. Nothing was heard on either
137.5 or 137.62 APT downlink frequencies. Dave Briggs at NOAA SatOps again
verified that the downlink should be 1698/ 137.5. This matches my HRPT
observation at least and is in agreement with the odd/even pairing used on
NOAA-9, 10, 11, 12, and 13.

The following element set was received from NOAA/GFSC for NOAA-14.
GCC DEC 30, 1994 12:48:35Z

* RS-15 NEWS *
==========
The following data on RS-15's orbit came from Ken Ernandes N2WWD via Ray Soifer W2RS. Based on some AOS, TCA and LOS findings Ken made up a Keplerian element set to match the claimed Boxing Day launch. These have since been 'tweaked' a few times to correct the slight discrepancies found, but the latest set are are still running true within +/- 20 seconds after four days of use. The original state vector from which Ken derived the Keps came from his own modelling assuming a 26th December 1994 03:00 UTC launch time is as follows:

Vector format = 10107
Satellite Name: RS-15
Catalog Number: 99915
Epoch MET: 0.04004629630
0/00:57:40.000 MET
EFG E: -3698.189817 km
F: -4493.256940 km
G: -6027.203350 km
Edot: 5.466925217 km/s
Fdot: 0.509012470 km/s
Gdot: -3.733879490 km/s
ndot/2 (drag): 0.00000000458 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.27563E-05 1/Earth Radii
Elset #: 2
Rev @ Epoch: 1.64733102495

The latest recommended working set, which should still hold well for a further ten days (until NASA/NORAD are able to sort out which specific object is being tracked) are:

RS-15 (Epoch) (Decay)
1 99915U 94360.16222500 .00000000 00000-0 13414-4 0 26
2 99915 64.5927 174.9040 0173416 233.4418 0.0000 11.27220872 13
(Incl) (RA) (Ecc) (A of P) (MA) (MM)

The latest NASA KEPS for the object we believe to be RS-15 (which is not the first that was listed as such) are:

RS-15
1 23440U 94361.79150546 -.00000043 00000-0 00000+ 0 26
2 23440 64.8297 172.1572 0188748 292.0126 66.1014 11.27113018 197

This set shows a lag behind the Doppler tracking by some 2.5 minutes, so it's best to keep to the first set given above e.g. 1 99915U for now.

The TLM beacon on 29.352 MHz is VERY strong, sending .."MMW14 INW11 ..etc.. RS15". The transponder uplink:downlink translation figure is ca. 116.504, e.g. f uplink - 116.504 = downlink, downlink + 116.504 = uplink.

At times the satellite (considering the distance and the inverse square law) is very sensitive, and the noise floor is clearly audible. 10w ERP provided G3IOR a downlink signal that was 6db above the noise. No more than 100w ERP (10w to 8 elements) is needed for uplink. Best and most QSB free downlink resulted by employing vertical polarization at most attitudes, and was even better than RHCP and LHCP, but this may change with time. Horizontal polarization gave by far the weakest signal and deepest fades. RS-15 is tumbling and toppling, showing spin fading at some 1 cps, sounding rather like AO-13 can. Despite RS-15 non-stabilization, this should slowly subside.

[Info via G3IOR]

* H-II LAUNCH DELAY *
==========
A NASDA press release issued on 27-Dec-94 reported that the launch of the Japanese H-II third vehicle has been postponed because a leakage was detected in a pipe of Reaction Control System (RCS).

The Institute of Space and Astronautical Science (ISAS), the New Energy and Industrial Technology Development Organization (NEDO) and the National Space Development Agency (NASDA) have been engaged in flight operation of the vehicle toward the launch on Feb. 1, 1995.

The new operation schedule would be decided early in January when the repair work would have been finished.

[Info via Yoshiro Yamada]

* SpaceNews ON-LINE! *
==========
There are several ways of accessing SpaceNews on the Internet. Those with e-mail capabilities can receive the latest issue of SpaceNews by sending an empty mail message to the following address:

infobot@infomania.com

The message must contain a subject line that reads:

#FINGER magliaco@pilot.njin.net

A ham-radio callsign look up can be performed by changing the subject to:

#CALLSIGN W6VIO

Those with direct access to the Internet can use the finger command to receive the latest SpaceNews issue:

finger magliaco@pilot.njin.net

SpaceNews may also be accessed using the File Transfer Protocol (FTP) by issuing the command:

ftp pilot.njin.net

Archives of past issues, satellite-related software, GIF images, and other information is available under the /pub/SpaceNews subdirectory. A new addition to this site is an education subdirectory that carries recent issues of "Education News" by Tom Davis, IK3WVJ/EA2CLS/KB7HTA.

60. Any SASI Tracker Users Out Here???

Newsgroup: rec.radio.amateur.space
Date: 1995-01-06 21:58:48 UTC
From: Ken Terry <ken_terry@macmail.eng.gulfaero.com>
Message-ID: <3ekeeoINNbj5@gulfaero.com>
Source record: 26009

I just started using the new SASI sat tracker with RealTrak to catch HRPT data from NOAA sats. Has anyone out here used the automatic track mode on the SASI? It is supposed to be able to receive a batch of track cords from RealTrak and run by itself, allowing your cpu to work full time cramming the 665K of data coming in from the Oribiter onto your hard drive.

Ken

Hi Ken.

What software do you use to receive Packet via your sound card?

62. MIR question...

Newsgroup: rec.radio.amateur.space
Date: 1995-01-07 04:54:56 UTC
From: cbdavis@ix.netcom.com
Message-ID: <3el6r0$rb1@ixnews3.ix.netcom.com>
Source record: 26011

The past several times that MIR has passed, I tried to connect but got bumped with message R0MIR BUSY. It seems that the mail box system was only transmitting not receiving. I have tried several times and MIR refuses to connect. If you have has success with MIR, let me know your secrets. I had MCOM and M on and all I saw were transmission FROM MIR to specific callsigns.

Thanks

Clint Davis

The Transit and Csikada satellites transmit on frequencies just below 400 MHz.
E-mail me for further details.

In article <3ejp46$6s2@pilot.njin.net>, magliaco@pilot.njin.net (John Magliacane) says:
>
>In response to the recent questions regarding PSK modulation and Pacsat
>operations, I would like to make reference to an article I wrote in the
>August 1994 issue of QEX that describes a Pacsat Modem I designed and
>built for digital satellite communications.
>
>The article not only describes BPSK, but also how it is handled by the
>modem circuitry, and its interconnections with a TNC, and is my attempt at
>clearing the confusion and lack of information on this subject.
>
G3RUH also has a file that can be downloaed from FTP.AMSAT.ORG
that explains raised cosine modulation. It's a .ZIP file that contains
the text and several .GIF images of illustrations. He describes it
thus:

------------------- Cut Here -------------------

The Shape of Bits To Come Oscar News (UK) 1991 Apr No. 88 p 29-37

This article is about bits, about bandwidth and about control of both.
What is the "raised cosine modulation" used on microsats AO-16/18/19? And
what is the RSM-8 on Rudak/AO-21? What PSK modulation does Fuji-20 use?
Come to that, what is BPSK, and similar abbreviations? Substantial
tutorial article, copiously illustrated.

(snip reprint list)

It is available on-line from ftp.amsat.org as the file:

/amsat/articles/g3ruh/a108.zip

Hi. You can easily hear these birds in advance of AOS because their 10 m downlink is affected by the F layer and will easily bounce thru hit the earth reflect upwards and downwards again....almost a double hop. I have heard this many times. Check the first LOS rather than the AOS. You can get a second LOS the same way. Hope that helps. Joe KO4EI

Source record: 26019

Here's another two cents worth on RS-15. I caught a 1115Z pass over my QTH in Shrewsbury, central Massachusetts, on 6 January 1995. Once again, AOS was about 10 minutes ahead of the RS-15? eleset from ARLK057. BTW, I'm using a G5RV for reception.
The transponder was very quiet. I was able to copy my downlink, very weakly, within two minutes of beacon AOS. Once again, best performance was with the bird approx. 30 degrees above my horizon. There was a very deep, long null when the bird approached maximum elevation. Copy resumed when the bird started back down. ERP is about 70 watts, and the pattern on my 3 element beam certainly isn't very tight
I managed one "partial" QSO. I heard several other stations on the downlink, including one on SSB, but was unable to copy callsigns.
I've read a lot of comments about "transponder power problems". As I read the specs, the *beacon* can put out twice the power of the *transponder*. That tells me that there is precious little power available per signal in the passband. Add the greatly increased altitude factor and it seems pretty obvious that a lot of RS-10 stations are going to come up short, me included (sigh).

The Jan 95 "The World of Ham Radio" CD-ROM newsletter is now available.
This CD-ROM offers more ham programs than any of the others out there!
Over 20,000 IBM files for amateur radio are stored on this CD-ROM.
Including FCC CALLSIGN call book with US & Foreign listings current to
12/94, AMCALL the new logbook from AmSoft that will auto log from the CD
for you. Over 1,350 Radio Modifications. The latest HST, NASA & Space
images. Over 700 Megabytes of Amateur Radio Software packed into 1 CD.
This CD-ROM is published every 4 months without delay in JAN, MAY, & SEP.

If you would like to get a FREE newsletter about the January 1995 AmSoft
CD-ROM please leave me your Internet E-mail information at:

Radio Meteor Observation Bulletin No. 17 January 1995

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.17 MHz
Transmitter Locations:
Katowice, PR3, Poland, 65.99 MHz, 14 kW, Distance 1100 km
P. Neant, PR3, Romania, 66.17 MHz, 40 kW, Distance 1400 km
Czestochowa, PR3, Poland, 66.23 MHz, 20 kW, Distance 1080 km
Gdansk, PR3, Poland, 66.29 MHz, 40 kW, Distance 1100 km

Antenna: crossed Yagi, 4 elements, Azimuth 270 o (=East), elevation 30 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava
Sensitivity: 8 muV for S/N = 26 dB (300 Ohm)
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored on file
in the University of Ghent format (Prometeos), and are available for
further analysis. Reduction software for DOS and Windows available].

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. % : transmitter outage during the whole hour or a part of it. Low counts indicate that no other interference, which could be confused with meteors, is picked up.
Few transmitters are broadcasting between 2h-4h local time (Sat-Sun 3h-5h local time) or sometimes longer. (When winter hour is in use: local time = UT + 1h).

. * : strong Geminid around Dec 14.0.
Best forward scatter conditions for this setup around 4h - 5h UT.

Maurice De Meyere / Chris Steyaert

Observer: Michael Hann
Location: Broken Arrow, Oklahoma, USA (96 00' W, 35 45' N)
Frequency: 67.260 MHz
Transmitter Location: Dallas, Texas, USA (distance 420 km)
Transmitter Power: 100 kW in video signal, continuous broadcast
Antenna: Three element Yagi, Azimuth 200 degrees, Elevation 18 degrees
Receiver: Commercial, Yaesu FRG-9600 purchased used
Sensitivity: 1 uV for S/N = 15 dB (SSB mode) (50 Ohm)
bandwidth in SSB mode: 2.4 kHz
VHS Recorder: NEC DX-5000U Hi-Fi VCR frequency range 20 Hz to 20 kHz
dynamic range > 90 dB channel separation > 60 dB

Observing method: Listened to audio tape recorded from receiver output

GEMINIDS December 14, 1994

Counts of reflections AFTER subtracting imputed sporadic rate
during hour intervals starting at UT:

Time | 00 01 02 03 04 05 06 07 08

Count | 76 141 208 184 180 89 70 23 79

Time | 09 10 11 12 13 14 15 16 17

Count | 197 518 661 472 382 317 151 59 19
** ** **

Notes:

* I monitored meteors on the night of December 28/29 -- when no
shower was active -- over the intervals 6:00-6:30 PM, 10:00-10:30 PM,
2:00-2:30 AM, and 6:00-6:30 AM local time. I extracted meteor count
data from these intervals and applied a least squared error method to
develop a linear equation fitted to this data which ramped the sporadic
in-fall rate from a minimum at 6 PM local time to a maximum at 6 AM
local time. I then subtracted these in-fall rates from each of my
Geminid counts in producing the counts above.

**The data show a distinct peak of the shower at 11 UT. There is
an unaccountable drop of meteor rates between 3:00 and 9:00 UT.
The shower radiant passed directly between my transmitter and receiver
at about 9:00 UT; this is when the observability function is at a
minimum.

Michael Hann

Observer: Ilkka Yrjola
Location: Kuusankoski, Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: narrow band FM, detected signal level >-122dBm.
Antenna: 2 element Yagi with 4dBd gain to SW.
Antenna Azimuth: 45 o
Computer: T-1000SE
Data sampling system: threshold crossing detection is fed in binary
form (1 bit) from the receiver, to the computer.
Computer logs total hourly elapsed reflection time, number of
threshold crossings for the hour, the longest time the signal was
continuously above detection level for the hour.

Data stored in the Compact MS-Soft format. Software for viewing available
from FTP.FUNET.FI pub/ham/vhf-work/mssoft42.zip

2. QUESTIONS TO ALL

-Daniel E. Warren (Rome Laboratory ERSE, warrend@rl.af.mil) is in charge of running what is known as a HERP (high effective radiated power) meteor burst communications link at one of their sites. It links to another system in Charleston South Carolina, feeding 4 kW into a 25 dB gain antenna array and a similiar receive array.
He invites amateurs on the eastern United States coast to make use of their transmitted signals.

-Ilkka Yrlola tunes to pager (semaphone) signals at 87.36 MHz, most probably in Sweden or Germany. Great advantage of these signals compared with FM radio is their continuous broadcasting at constant power.
Ilkka is looking for the transmitter data (location, power).

[This is the Eurosignal system: its two carrier frequencies are 87.34 MHz and 87.365 MHz - CSt].

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

2. QUESTIONS TO ALL

-Daniel E. Warren (Rome Laboratory ERSE, warrend@rl.af.mil) is in charge of running what is known as a HERP (high effective radiated power) meteor burst communications link at one of their sites. It links to another system in Charleston South Carolina, feeding 4 kW into a 25 dB gain antenna array and a similiar receive array.
He invites amateurs on the eastern United States coast to make use of their transmitted signals.

-Ilkka Yrlola tunes to pager (semaphone) signals at 87.36 MHz, most probably in Sweden or Germany. Great advantage of these signals compared with FM radio is their continuous broadcasting at constant power.
Ilkka is looking for the transmitter data (location, power).

[This is the Eurosignal system: its two carrier frequencies are 87.34 MHz and 87.365 MHz - CSt].

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

I'd suggest using the signal from a geosynchronous TV satellite
as the timing reference, and a VCR as the recording system.
The relative timing of one station to another is then just a
matter of geometry.

>It may transpire that a broad spectrum of frequencies can
>be observed. The data received by a single station would
>of course be unintelligible as the practical limitations to the
>receiver temperature of an amateur station, however as the
>signals from many stations are combined the system noise
>temperature will reduce dramatically.

By stripping only the sync and burst from the TVRO source,
and inserting received signals in place of the video, a
VCR can record a 4 MHz segment of the spectrum as a single
chunk.

Gary

From: Chris Oesterling <chris@angus.mystery.com>
Message-ID: <Le0Nyc1w165w@angus.mystery.com>
Source record: 26027

I'm wondering if anyone has had a problem I'm having receiving
GOES-8. The IRO images come out quite well. The re-transmitted
Met5 images come out PERFECT. The VSO (I assume visual images)
come out very dark with only state/country borders visable.
Even the lines are not as clean. My receiver has been modified
for a wider bandwidth (50khz). When I use it for NOAA 9-12,
the images come out great too. Just the VSO's are bad. Is it me?

One other question I'd be pleased to find the answer to.
The identification bar at top of the GOES8 images display "US" for
United States view (obviously), NE - North East, NW - North West,
SE - South East, SW - South West, TE - ????? East, TW - ????? West.
What the heck does the "T" stand for?

Thanks for your help! It sure is nice to have people to ask questions
like this to.

Jeff,

Archie out xsat e.g.

ftp://seds.lpl.arizona.edu/pub/software/unix/sat/xsat1.0.tar.Z

Or if you hang on Manfred Bester's excellent sattrack should see its
v3.0 incarnation shortly - this will have X11 graphics capability too.

This is a problem common to all DOS machines. The crux of the problem
is that the PC's hardware clock is only read at boot time (by MS-DOS).
After that the Time-of-Day clock is updated by a software interrupt
which simply adds a clock tic to a counter which is, in fact the TOD
clock. If your system is 100% CPU bound, as it surely is running a sat
tracker, there is little spare time to update the TOD clock. A possible
solution would be to write a TSR to re-read the hardware clock and
update the TOD clock.

Another possible solution is to run your sat tracker under Linux,
Windows NT or OS/2 since they do not suffer from this brain damage.
I run SatTrak 3.8 under Linux and NT with no worries.

Best,

dave

Message-ID: <3eumm4$8n7@superb.csc.ti.com>
Source record: 26035

The W1AW Keps published Saturday still have the same problems.
I've seen some 2 line elements that had been tweaked to work, but
they gave a checksum error message when loaded into Instantrack.
If I remember correctly, they were still off 20 seconds or so.

Is there a NORAD Home Page or ftp site that may have some corrected
data that could be used to generate some Keps?

This bird is pretty weak on some passes. It would seem that when this
situation exists, we could use as much ERP as it takes to cause the
transponder to hear our signal and repeat it. Using 10W ERP may work
on some passes, but I haven't heard a pass that good yet. I have only
been working the high (<30 deg) passes. Maybe the low passes are more
suited to low power for some reason.

This is not entirely correct. It doesn't matter if the machine is CPU bound
100%, the clock will update reliably. This is because the timer tick is
interrupt driven, from the Timer 0 channel, and is sourced by the 14.some_odd
megahertz clock that is used for bus timing, and in the old days, color burst
generation. The problem is someone is leaving interrupts turned off for too
long, and ticks are getting missed. This has NOTHING to do with the machine.
It's all in the code you're running (like any TSRs, heavy serial I/O without
using a 16550 SCC, etc). The only other scenerio that comes to mind is that
perhaps your oscilliator is off, but for that kind of drift, you'd most likely
have other (more severe) problems.

Attached below is an excerpt from the documentation for STSORBIT PLUS which addresses this problem and provides a nicely detailed discussion of two programs that will fix the problem. I have no personal experience with either of these programs -- I just remembered reading about them in the STS+ docs when I saw Gerald's posting. Hope this helps....

KB6JXT, Todd

~ ~

Maintaining Accurate DOS Time

Just in case you missed the point earlier, accurately setting DOS time is only half the battle. Even if the DOS time is set very precisely as discussed above, all that assures is that the time is correct to the required accuracy at that instant. The problem then becomes one of knowing how the DOS clocks change or drift with time and how to compensate for those changes or, alternatively, checking the DOS time frequently enough that any drift on the part of the DOS clocks is acceptable for the intended application.
Of the two clocks in a typical personal computer, the hardware clock is considerably more consistent and reliable. I have checked perhaps a dozen PC hardware clocks in recent years, and almost all kept reasonably good time over a period of several days; as expected, none kept "perfect" time. Typical drift rates ranged from about 3 seconds per day to near zero seconds per day, with the magnitude and direction of the drift more or less constant over the period of measurement. The hardware clock is typically sensitive to both voltage and temperature, both of which undergo significant change when the computer is turned on or off. Complete calibration of the hardware clock requires knowledge of its performance under both circumstances. Once a hardware clock has been calibrated, its performance may be predicted with reasonable accuracy over periods of some weeks or more. Crystal aging rates suggest that calibration should be performed at least monthly.
The hardware clock is normally interrogated only when the computer is first started or rebooted. The correct time can therefore be predicted at that moment for a calibrated hardware clock, given the last time that clock was synchronized with an appropriate time standard. Microsoft provides no standard software tools for interrogating the hardware clock at other

times except for low level interrupt services. Quite the contrary; beginning with DOS Version 3.3, using the DOS TIME and DATE commands to set the DOS software clock will also set the hardware clock and effectively destroy its usefulness as a calibrated time reference. I am at a complete loss to understand the reasoning behind this change in DOS; I presume that users were being "confused" by differences between the hardware and software clocks; instead of either explaining or fixing the problem, Microsoft elected to "legislate" the problem away -- a process any politician would recognize instantly. The only mitigating consideration is that any really effective solution would probably require hardware as well as software changes. Blame IBM, I guess.

The software clock provides the only time information readily accessible to DOS using standard software. Since this clock is maintained entirely in software, with no reference to the hardware clock except at bootup, it is at the mercy of other software which may execute from time to time. The software clock increments its time using "interrupts", a technique which stops a software process in progress just long enough to do the required tasks and then resumes the interrupted process. These interrupts occur every 55 milliseconds. So long as none is missed, the software clock should keep accurate time -- if the software is written correctly and if the computer's crystal controlled oscillator is in turn accurate. It may be that neither of these conditions is true; certainly the crystal controlled oscillator (quite similar to the one which runs the hardware clock) was not designed for accuracy or stability. It's original purpose was solely to generate the necessary timing signals for the operation of the computer. Cost, not accurate time, was the primary consideration in its design.

Other software designers have contributed to the problem by writing software which, deliberately or inadvertently, prevents the software clock from being updated. Off-brand BIOS firmware can present occasional problems. Local Area Network (LAN) and high speed communications software are also frequent culprits in this respect. For example, a casual check of the clock while using a high speed computer-to-computer file transfer program indicated that the clock was effectively suspended when data transfers were in progress. In one relatively brief test, the DOS clock lost about 30 seconds.

As a result of all of these factors, the accuracy of the DOS software clock can vary wildly from one computer to the next and from one situation to another. One inexpensive "clone" computer that I'd rather forget couldn't manage to keep time to better than about 30 seconds per HOUR! Before planning to use a particular computer as a time reference with programs like STSPLUS, check the computer hardware and software you intend to use very carefully.

Programs TIMESET and RIGHTIME

Two fine programs, TIMESET by Peter Petrakis and RIGHTIME by Tom Becker, provide all the features required to accurately set and maintain the computer's hardware and software clocks. Development efforts on these programs have been carefully coordinated so that they cooperate with each

other. Both programs are copyrighted commercial software distributed as "shareware" and require registration after an initial evaluation period. I highly recommend these programs and encourage users to support the authors and their work. So far as I know, there are no other comparable programs available at any price!

TIMESET, Version 7.10 or higher, uses the telephone time services of NIST, USNO, and three European services to precisely set the computer clocks. The standard distribution also includes several additional time-related utility programs. It is available on many computer bulletin board systems or direct from:

Peter Petrakis
Life Sciences Software
8925 271st N.W., Suite 112
Box 1560
Stanwood, Washington 98292 USA

Telephone: (206) 387-9788

RIGHTIME, Version 2.5+, is a program to compensate for the various drift factors in a computer's hardware and software clocks. When used in conjunction with TIMESET and properly calibrated, RIGHTIME "learns" the warm and cool drift factors for a specific computer. As a result, the clock's can be maintained with an accuracy of a fraction of a second over long periods of time. It is available on many computer bulletin board systems or direct from:

Tom Becker
Air System Technologies, Inc.
14232 Marsh Lane, Suite 339
Dallas, Texas 75234 USA

Telephone: (214) 402-9660

Tom Becker and Peter Petrakis may be also contacted directly on the Air Systems Technologies computer bulletin board system in Dallas, Texas. The BBS always has the latest versions of TIMESET and RIGHTIME available for download:

Air Systems Technologies BBS
(214) 869-2780

STSPLUS is now "aware" of program RighTime and its use is recommended for accurate timekeeping. Audible alarms in prior versions would perform unpredictably when RighTime was active because they use the hardware clock's timer functions (which RighTime also uses). STSPLUS now detects RighTime and temporarily disables RighTime while an audible alarm is being generated and then re-enables RighTime after the alarm has completed, restoring precise timekeeping. With RighTime active, alarms are generated in foreground, which may cause a slight delay in screen updating.

****
* CAUTION *
****

STSPLUS expects RighTime Version 2.5+; performance with prior versions of RighTime may yield unpredictable results. If using a prior version of RighTime, do NOT enable audible alarms!

If RighTime is not present or is not detected, the audible alarms are generated in background as in prior versions. This usually causes the loss of several clock ticks in the DOS software clock for each audible alarm. Although the time loss per audible alarm is very small, the cumulative error may become significant over extended time periods.

The following descriptive text is extracted with permission from the documentation for the current versions of TIMESET and RIGHTIME; please consult the documentation for each program for full details. Although future versions of both programs are expected to remain compatible with STSPLUS, they should be tested carefully before regular use.

FEATURES OF TIMESET 7.10

TimeSet has been evolving steadily ever since the first version was released in the summer of 1987. That version and several subsequent ones could only set a computer's clock from the U.S. Naval Observatory (USNO) in Washington, D.C. Version 6.00, released in 1990, added ability to use telephone time signals from the National Institute of Standards and Technology (NIST) in Boulder, Colorado, making it the first program of its kind able to address more than one atomic time service. This made it possible for computer users in the eastern and western United States to keep down long distance bills by choosing the time service closest to them. Version 7.10 continues that evolution with a number of new features and supporting utilities:

o TimeSet can now access five atomic clock-based telephone time services on two continents: the USNO and the NIST in the United States, as before, and atomic time services in Sweden (National Time and Frequency Laboratory), Austria (Technical University of Graz), and Italy (National Electrotechnical Institute). People in European countries who want to set their computers to an atomic clock no longer need to make a trans-Atlantic phone call.

o TimeSet 7.10 is designed to interact closely with version 2.5+ of RighTime (tm), the excellent memory-resident regulator for computer clocks developed by Tom Becker of Air System Technologies, Inc., Dallas. RighTime learns the drift rate in the computer's clock and continuously applies a correction to compensate for it, and it refines the correction each time the computer clock is set. A computer with RighTime installed and trained can maintain system clock accuracy within a second for at least a week. Furthermore, version 2.46 provides true 0.01-sec resolution in the DOS clock, in contrast to the normal 0.055-sec resolution. This allows greater accuracy in

timesetting than ever before, indeed the maximum accuracy that can be obtained with a computer clock. Life Sciences Software and Air System Technologies cooperated closely during the development of TimeSet 7.10 and RighTime 2.46, with the result that TimeSet can access several RighTime functions directly.

"TIMESET" is a trademark of Life Sciences Software (TM)

The following is a screen dump of the data displayed by TIMESET:

```
+------------------- From NIST. Connect time: 11.97 sec. --------------------+

```

FEATURES OF RIGHTIME 2.5+

RighTime brings exceptional system time of day clock performance to the DOS-based AT-class-compatible PC computer with no additional hardware. With RighTime installed, the standard real time clock system becomes an Adaptive Mathematically Compensated Crystal-controlled Oscillator based clock. Under stable conditions, RighTime can produce a system clock that keeps time within one half second per week or better (some testers have reported accuracy of 0.07 second per week); this is about 0.8 parts per million error, or more than 100 times better than an unconditioned crystal time base alone, or 30 times better than a moderately conditioned one like a modern watch of quality.

o True one hundredth second DOS clock resolution: the 55-millisecond barrier is broken! The standard DOS clock resolves to only about 1/18 second; under RighTime v2, the new high resolution DOS clock resolves

to, and increments in, hundredths while the Int 08h and 1Ch tick rate remains standard.

o RighTime intrinsically sets the hardware clock and solves the midnight rollover date bug that exists in some DOS versions; this eliminates the need for other utility programs or drivers that perform these functions. Unlike DOS alone, the hardware clock seconds transition will be properly set by RighTime and the time will be set to hundredths of a second resolution, and these qualities will survive through rebooting.

o Each time you set the time, RighTime will improve the accuracy of the clock error corrections and will subsequently improve the accuracy of the clocks. It should be easy to achieve a worst-case error of less than 0.5 second per day and under good conditions, less than 0.5 second per week; typical results are much better. Command line options are provided that allow fine tuning the correction process to your system. A trimming option provides for offset adjustments in hundredths of a second.

The following is a screen dump of the data displayed by RIGHTIME:

RighTime: Indicated DOS clock date and time is 1993/03/05 06:04:45.66.
RighTime: Warm correction rate is +2.83 seconds per day.
RighTime: Cool correction rate is +4.27 seconds per day.
RighTime: Current applied DOS-CMOS RTC offset is +0.46 second.
RighTime: Last CMOS RTC adjustment was 0.00 hours ago.
RighTime: Last timeset was 23.33 hours ago.
RighTime: System has been warm 17% of the time since the last timeset.
RighTime: Stack A headroom is 92 bytes; Stack space used is 68 bytes.
Stack D headroom is 100 bytes; Stack space used is 60 bytes.
RighTime: /?=Help; Version 2.53

```
SatTrack V3.0 Release
January 11, 1995

SatTrack V3.0 is ready to be released. This new version is an improved
version of V2.0. The main addition is an X Window color graphics display.
The distribution file can be obtained via anonymous FTP. Do the following:

ftp 128.121.50.2 (ftp.jvnc.net)
Name: anonymous
Password: your_email_address
ftp> binary (this line is important!)

ftp> cd /priv/kupiec/incoming (do the 'cd' in ONE step!)
or
ftp> cd /priv/kupiec/sattrack (do the 'cd' in ONE step!)

ftp> get sattrack.V3.0.tar.gz
ftp> quit

WARNING: If you want to save some of your special resource files of a
previous SatTrack version, these will have to be saved somewhere else
temporarily, because the procedure described below will overwrite these.
However, the format of some of the resource files had to be changed to
allow for extra features. The format of the new files may not be compatible
any more with those from previous releases.

Place the distribution file into your Unix home directory, 'uncompress' it
(or, if the file name ends on 'gz', 'gunzip' it), and then type
'tar xvpf sattrack.V3.0.tar'. This will unbundle the distribution file and
will create all necessary sub-directories. Then look into the documentation
file 'sattrack.doc' in SatTrack/doc for instructions how to compile sattrack
(and some other auxiliary programs). It should compile perfectly on at least
Sun workstations with SunOS and Solaris, and on i386 laptops running Linux.
Make sure the compiler and linker flags in the Makefile are configured
properly!

Please let me know how the installation went and if you encountered any
problems, bugs or imperfections, of if you have other suggestions.

Manfred

WXSAT - MAIL - LIST problem?

I missed the postings of WXSAT -LIST since about SAT 5 JAN.
I also did not get answer or bounce of email to wxsat-admin.

Email at my site (in/out) tested and works ok.

Responses greatly appreciated.
Thanks for Your effort!

Has anyone heard the XX9 dx-pedition station in Macau?

Oscar Satellite Report says this station should be on the air from 9-13 January. I didn't hear them the last two nights, and tonight is my last window.

Wayne Estes WD5FFH wayne@csg.mot.com

95. Help: traksat v3.0

Newsgroup: rec.radio.amateur.space
Date: 1995-01-12 23:26:24 UTC
From: fjorozco@academ07.mty.itesm.mx
Message-ID: <FJOROZCO.95Jan12172624@academ07.mty.itesm.mx>
Source record: 26045

Hi all, I got a copy of Traksat v3.0 from oak.oakland.edu and I'm having some trouble with it. It runs, but when I try to use the ground tracks or orthogonal view options it kicks me back to DOS and then locks up with an "overvlow -- runtime error R6000" error, or a "divide by zero" error. I'm using a 486DX machine, and I've never had this problem before.

Any ideas??? please reply via email to fjorozco@academ01.mty.itesm.mx since I don't get to read the newsgroups too often.

thanks and 73 de Luis N5UHB

Louis Botha (sttlmb@puknet.puk.ac.za) wrote:
: I have heard that the so called new generation NOAA's will soon be in orbit.
: Can anyone please supply my with info on this subject (freq. , transmission
: formats, date of launch etc.).

: Thanks

: Louis Botha

There was some discussion about them in '94. The new format is to be called
LRPT, a digital mode with compression and higher rez. The same frequencies
would be in use as now, 137mhz. band. Believe this format will be phased-in
during launches scheduled around 2002-2005, not during the '90s.

Chris Oesterling (chris@angus.mystery.com) wrote:
: I'm wondering if anyone has had a problem I'm having receiving
: GOES-8. The IRO images come out quite well. The re-transmitted
: Met5 images come out PERFECT. The VSO (I assume visual images)
: come out very dark with only state/country borders visable.
: Even the lines are not as clean. My receiver has been modified
: for a wider bandwidth (50khz). When I use it for NOAA 9-12,
: the images come out great too. Just the VSO's are bad. Is it me?

The visible ones appeared normal to me up til Jan 7, which was the
last time I viewed them. Remember this time of year, solar illumination for
the US is lower, things will brighten up some as we approach summer.

:
: One other question I'd be pleased to find the answer to.
: The identification bar at top of the GOES8 images display "US" for
: United States view (obviously), NE - North East, NW - North West,
: SE - South East, SW - South West, TE - ????? East, TW - ????? West.
: What the heck does the "T" stand for?

TE="Tropical East"
TW="Tropical West"

The Jan 95 "The World of Ham Radio" CD-ROM newsletter is now available. This CD-ROM offers more ham programs than any of the others out there! Over 20,000 IBM files for amateur radio are stored on this CD-ROM. Included are the FCC CALLSIGN call book with US & Foreign listings current to 12/94, and AMCALL the new logbook from AmSoft that will auto log from the CD for you. Over 1,350 Radio Modifications. The latest HST, NASA & Space images. Over 700 Megabytes of Amateur Radio Software packed into 1 CD. This CD-ROM is published every 4 months without delay in JAN, MAY, & SEP.

If you would like to get a FREE newsletter about the JAN 1995 AmSoft CD-ROM please send your Internet E-mail address to: amsoft@epix.net

>
>
>I heard Meteor 3-5 today transmitting visible pictures.

Yes, received good images. But only trouble is that Meteor 3-5 is approx
13 minutes 'ahead' of NOAA 14. So if you wish to receive both, you
would have to truncate the Meteor 3-5 reception before it fills up the
monitor.

ARLS002 RS-15 launch a first

ZCZC AS81
QST de W1AW
Space Bulletin 002 ARLS002
From ARRL Headquarters
Newington, CT January 13, 1995
To all radio amateurs

SB SPACE ARL ARLS002
ARLS002 RS-15 launch a first

The recently launched RS-15 Russian satellite was sent aloft on the
first successful test flight of a new launch vehicle.

RS-15 was the only passenger on the new ''ROKOT'' rocket, a joint
commercial venture between Germany and Russia. ROKOT is described
as a low cost launcher for small satellites into low-earth and
sun-synchronous orbits and will be available for commercial launches
by the end of 1996, according to Peter Guelzow, of AMSAT-DL.

ROKOT may also offer economical launch opportunities for Amateur
Radio satellites and experiments, Guelzow said, and the ''user's
manual'' for ROKOT will be made available to AMSAT-DL, he said.

RS-15 is now operational; Keplerian data is available on W1AW.

SB NEWS @ AMSAT $SPC0116
* SpaceNews 16-Jan-95 *

BID: $SPC0116

=========
SpaceNews
=========

MONDAY JANUARY 16, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited free distribution.

* RS-15 NEWS *
==============
Pat, G3IOR reports that in addition to a Mode 'A' transponder, RS-15 also
a Mode 'K' and 'T' transponder. However, UA3CR repoorted that it will be
kept in Mode 'A'.

Sadly, RS-15 will be the last RS satellite. The funding for future RS
satellites is gone. However, the UA facility will still build for future
AMSAT etc, satellites.

* H-II NEWS *
=============
The H-II Rocket with the Space Flyer Unit (SFU) and Geostationary
Meteorological Satellite-5 (GMS-5) aboard is scheduled to be launched
as follows:

1. Primary Launch Date: February 22, 1995

2. Launch Windows: 17:10 to 19:30 JST

3. Alternative Launch Period: February 23 to 28, 1995

While the SFU was being prepared and tested for launch by H-II
No. 3 at NASDA, Tanegashima Island Facility, a leak in the tubing
of the attitude control equipment was found December 21.

The leaking part was transported to MHI in Nagasaki plant December 27
for repair, and we found that the leak was caused by a crack (almost 2mm)
in the welding. We repaired the welding (rewelded) and returned the part
to NASDA Tanegashima Center on January 3, 1995.

[Info from NASDA via Yoshiro Yamada]

* NOAA-14 OBSERVATION *
=======================
Oded, 4Z5BS, reports copying NOAA-14 on 137.620 MHz with excellent picture quality, and found a close correlation between the published Keplerian data for the satellite and its actual orbit.

* MIR NEWS *
============
The following message from the cosmonauts on the Russian space station Mir recently appeared on their packet radio BBS and was copied by Toshio Tango, JR8XPV:

Stat : PR
Posted : 94/12/31 11:45
To : ALL
From : R0MIR
@ BBS :
BID :
Subject: HAPPY NEW YEAR

TO EVERY OF YOU, WHO CONGRATULATED US WITH 1995, OUR CREW WISHES HEALTHY, LUKY AND HAPPINESS YOU, YOURS FAMILY AND FRIENDS. 17TH BASIC MISSION ON THE RUSSIAN SPACECTATION "MIR": COMMANDOR - A.VICTORENCO, BOARDENGINEER - H.CONDACOVA, PHYSISHEN-COSCIAN-INVESTIGATOR - V.POLYAKOV. R0MIR.

Miles, WF1F, reports that the packet radio BBS on Mir is active and working well. The only problem is the TNC has only a 22 kilobyte message storage area and it fills up quickly. As a result, the crew has posted the following message:

Stat : PR
Posted : 95/01/13 08:37
To : ALL
From : R0MIR
@ BBS :
BID :
Subject: NOTE

DEAR HAMS! PLEASE, AFTER READING YOUR OWN MSG, KILL IT!

Miles reminds us that the Mir BBS should not be used in place of a Pacsat satellite or a terrestrial BBS. Terrestrial messages placed on the Mir BBS should include a packet radio return address, so responses can be directed by way of the packet radio network, and not the Mir space station.

Also remember that the Mir PBBS can only accept one connection at a time. All other stations must STOP calling the Mir PBBS while a station is actively using the Mir PBBS. Calling the Mir PBBS, while someone else is logged in and trying to transfer data is poor operating practice and could be considered "intentional interference".

And lastly, do not use computer software to automatically connect to R0MIR once packets have been received from Mir. Recently, tremendous interference was received from such an automated station after the

Cosmonauts switched off the TNC and (unsuccessfully) attempted to make
voice contacts.

* SAT TRACKING FOR UNIX/LINUX *
==============================
SatTrack V3.0 Release
January 11, 1995

SatTrack V3.0 is ready to be released. This new version is an improved
version of V2.0. The main addition is an X Window color graphics display.
The distribution file can be obtained via anonymous FTP. Do the following:

ftp 128.121.50.2 (ftp.jvnc.net)
Name: anonymous
Password: your_email_address
ftp> binary (this line is important!)

ftp> cd /priv/kupiec/incoming (do the 'cd' in ONE step!)
or
ftp> cd /priv/kupiec/sattrack (do the 'cd' in ONE step!)

ftp> get sattrack.V3.0.tar.gz
ftp> quit

WARNING: If you want to save some of your special resource files of a
previous SatTrack version, these will have to be saved somewhere else
temporarily, because the procedure described below will overwrite these.
However, the format of some of the resource files had to be changed to
allow for extra features. The format of the new files may not be
compatible any more with those from previous releases.

Place the distribution file into your Unix home directory, 'uncompress' it
(or, if the file name ends on 'gz', 'gunzip' it), and then type
'tar xvpf sattrack.V3.0.tar'. This will unbundle the distribution file and
will create all necessary sub-directories. Then look into the documentation
file 'sattrack.doc' in SatTrack/doc for instructions how to compile sattrack
(and some other auxiliary programs). It should compile perfectly on at
least Sun workstations with SunOS and Solaris, and on i386 laptops running
Linux. Make sure the compiler and linker flags in the Makefile are
configured properly!

The author asks that he be informed of how the installation went and if any
problems, bugs or imperfections were encountered, of if you have other
suggestions.

: Jerry Ward.
first of all let me suggest you look at the october 93 issue of
BYTE magazine, page 57 article "Keeping Time on Your PC" by Michael Lombardi.
this article addresses keeping time on your pc (DOH!) but also gets into
the accuracy of a pc real time clock. According to the article
the pc clock will generate a interrupt every 54.936 msecs and count these.
Now it can only display multiples of this value so you miss some times.
Thus it drifts 1 to 15 seconds per day with 5 to 6 seconds per day being
typical.

There is also a I'net site listed for some code and info on this
its 132.163.135.130 and you can ftp to it to get program code and such.
I looked at this code awhile ago but never used it.

My personal story is this, i was trying to set the pc clock using a GPS
receiver so that we could keep accurate time with the pc's and synchronize
multiple pc's. This never happened, i had to write some C code to constantly
read the gps time and keep it as the reference (kinda sucks) anyway, if you
really need a accurate clock in your pc i suggest you talk to some of the
companies that sell accurate clocks for the pc that replace the old RTC with
a plug in card and you can even connect this to a GPS receiver to keep it
completely accurate. Such a company is datum, inc try emailing them
at datum.com

also, note that the problem with the clock is based on the accuracy of the
RTC and the bios of the system so it is my impression that this problem
would prevail on any pc, unless you write some code to correct the offset
(which such code is on the above ftp site)

best of luck,
jess

ps the ip address above is alos time_a.timefreq.bldrdoc.gov (hey who better
to get correct time from than NIST?)

104. Should AMSAT-BB mailing list be sent here?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-14 16:52:54 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3f8vh6$em4@news.doit.wisc.edu>
Source record: 26054

As many of you may know, AMSAT has a mailing list, AMSAT-BB. I've
been a subscriber for a few months and I really like it. I think many
people here would like it too.

I think it would be possible to send all the AMSAT-BB messages to this
newsgroup - it would just require adding one of the email-to-newsgroups
addresses to the mailing list.

The question is, should it be done? The list is running about 30
messages a day recently, on topics ranging from how to align OSCAR
antennas to software for the pacsats to RS-15 and its orbit, plus
many, many more themes. The information seems to be very reliable -
some of the biggest names in amateur satellites subscribe to the list.

I haven't suggested this on the mailing list yet because I thought it
would be best to ask readers of this newsgroup first before doubling
or tripling the number of messages posted to it each day. Does anybody
have any comments, pro or con?

N9LTD - Dave Mullenix - djmullen@facstaff.wisc.edu
Listen to the EZSAT Report on This Week in Amateur Radio
Saturdays at 5:30 Eastern Time on Galaxy 3, Transponder 17, 5.8 MHz audio.

106. Anyone heard XX9 station?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-15 16:22:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A1A232.14E6000019.uuout@freddy.supernet.ab.ca>
Source record: 26056

Hi Wayne,
Sorry not what you want to hear. "NO"....been listening and
working AO-13 on the dates you said but not heard at all....also had
people inquire and looking.

I did work XX9AS (Albert) on Dec 31/94 06:58z but I don't think you want
to hear that either Hi Hi.

Good luck in the furture and I'm sure that XX9 will be on again.

107. Need mod for IC-275

Newsgroup: rec.radio.amateur.space
Date: 1995-01-15 16:32:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A1A23C.14E600001A.uuout@freddy.supernet.ab.ca>
Source record: 26057

Hi, I'm looking for the mod that will make my IC-275H general coverage transmit (in other words transmit same as receive 138 to 174 Mhz).

I need this mod for "S" band transverter coverage....any info would be greatly accepted.

Thanks in advance.

73 de Ernie VE6LU (ernie.koch@freddy.supernet.ab.ca)

108. AMSAT-BB on this list

Newsgroup: rec.radio.amateur.space
Date: 1995-01-15 17:38:54 UTC
From: erik@ve7mdl.ampr.ORG
Message-ID: <1126@ve7mdl.ampr.org>
Source record: 26058

Dave suggested including AMSAT-BB on this list.

Dave and everyone,

My system receives this list via a 9600 Baud radio link. The link is flakey and adding 30 messages to it would likely cause me some problems. So I would vote against it.

73 de VE7MDL ....Erik.

>
Well, I heard the beacon (real strong) and a fair amount of activity in
the passband (the 40 kHz or so above the beacon). Receiver is an IC-725
and a ground mounted quarter wavelength vertical or a 66 foot center fed
flat top.

>Being a seething greenhorn who has no way to uplink, is the other beacon
>functional? Is this bird typically quiet ?

Had QSOs on each of two passes. Many signals seem a little weaker than on
RS-10 but still plenty strong. My uplink, 60 watts into a J, which is
just adequate for RS-10 is marginal for RS-15. I suspect that signals from
folks with rigs like mine will seem weak until we get steerable directional
antennas or more power - but there seems to be lots of activity.

PRESS RELEASE

JANUARY 17, 1995

WVARA ANNOUNCES WEB PAGE

The West Valley Amateur Radio Association (WVARA) is announcing the development of it's own home page. WVARA joins the ranks of many other amateur radio clubs in having a home page with links to other points of interest to other hams. This includes links to other clubs, the FCC gopher server, all of the amateur radio related UseNet groups and other Web points of interest to hams.

The WVARA home page is run in conjunction with a law-oriented home page, providing links to most legal-related web points of interest.

The WVARA home page can be visited at:
http://www.portal.com/~twise/

For more information, e-mail twise@sparta.sjsu.edu

Travis A. Wise

Boy, talk about embarassing - I've had a half a dozen requests on how to sign up for the AMSAT-BB mailing list and I forgot how to do it! The directions were in the AMSAT newsletter some time ago and I can't find that issue. I sent a request for into to AMSAT-BB and was told:

Send subscribe and unsubscribe requests for amsat-bb to listserv@amsat.org, ans news bulitens and keps are also available

Give it a try an dlet me know if it doesn't work.

73, Dave, N9LTD

123. Need satellite tracking software or equations

Newsgroup: rec.radio.amateur.space
Date: 1995-01-20 08:13:03 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.279.000FFD6A@mail.mei.com>

I'm looking for any satellite tracking programs for the HP48 series calculators.

I'd like to track at least one, preferably multiple, satellites using Keplerian elements/satellite almanac data and display a rough graphic of satellite position (fish-eye view of the sky) based on my current time, longitude and latitude. More "exact" numeric data should be available as well.

Regardless of the availability of an HP48 program, I'd appreciate any references to the mathematical models/techniques which would allow me to write my own software. (I can program in HP48 RPL, C, C++, PASCAL, FORTRAN, numerous assembly languages and, if absolutely neccessary, BASIC ;-))

I am already aware of DOS-based programs that will do this.
I just want to learn more about the techniques/math for myself.

Thanks.

I would also be interested in the math/techniques and whether or not there is a program for the hp.

Please post here. Or email me at cmlong@mtu.edu

Thanks
Mike

A great book is "Fundamentals of Astrodynamics" by Bate, Muller, and White
(also known as the BMW book). Published by Dover (ISBN 0-486-60061-0) for
$10 (yes, ten bucks! a great book, and cheap!).

I started with this book and my HP48 while on vacation in Mexico last
year; I've continued working on C code when I can get the time.

126. Equipment help

Newsgroup: rec.radio.amateur.space
Date: 1995-01-20 19:37:52 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9501201937.AC00036@rtp41.rtp.dg.com>
Source record: 25825

CEO document contents:

It looks like it may be about time to upgrade the satellite station, and I'm looking to the group for input. I'm one of those unfortunate people who's operating has some constraints, so I want to maximize what I have available. If anyone can help me out, it will be greatly appreciated.

My first limiting factor is my housing. I'm in a single family dwelling in a rural neighborhood. That's not a problem, but I am renting and there are a good many trees around. My landlord and I have a good relationship, and he has allowed me to string up some dipoles and erect an R-7. I also have Eggbeaters for 2M and 70cM. A tower is OK with him, but I can't imagine where it would go, so I'm pretty much stuck with the LEO's. Again, not a problem. I'm on AO-16, LO-19, and RS-12 with no problems whatever.

My second limiting factor is money, but that's probably not uncommon, is it?

Here's the real puzzler: It seems the IC-251A has developed a transmit problem. My RS-10 downlink sounds horrid, so I'm off that bird. In all likelihood, repair would be more than it's worth. Besides, I'm not really happy with the 100Hz tuning; 10HZ is more like it. Also, I've got a 9600 baud modem that would get me on the other digital satellites nicely, so it seems a new rig is in order.

If you've followed me this far, you can see what's coming next: Please send your suggestions, advice and/or experiences with 2M radios that I could get for < $800-1000. I think if I have to choose, I would go with SSB/CW and limit myself to 1200 baud/PSK on the digital side, but it sure would be nice to have that 9600 baud available! (All of my digital uplink now is with a reactance modulated mobile, no good for 9600.) I have a 10W in/80W out Mirage pre-amp/amp, so high power is not a necessity with the radio, but it's not out of the question to sell it and just get a pre-amp for use with a rig in the 75-100W class. I won't rule out used equipment, either.

Well, that's the story and my urgent plea. I will be glad to take all suggestions. If I get enough responses, I'll publish what I've learned so others can share.

Thanks again es 73,

Gary WA4YMZ FM05 Apex, NC Gary Rogers@DGC.CEO.DG.COM

AO-16, LO-19, RS-12 now and RS-10, RS-15 soon, I hope.
(UO-22, KO-23, KO-25 wouldn't be bad either)

127. RS-15

Newsgroup: rec.radio.amateur.space

Message-ID: <8A1F419.14E6000035.uuout@freddy.supernet.ab.ca>
Source record: 25839

Hi Dennis,

-> Well I listened for RS-15 this last weekend to see it I could hear
-> the 10 meter side of the link. I was able to hear the beacon at
-> 29352 but I did not hear anything on the downlinks or the other
-> beacon.
->
-> Being a seething greenhorn who has no way to uplink, is the other
-> beacon functional? Is this bird typically quiet ?

Well, I think we need to help you out a bit here....You should be able
to hear the downlink if you can hear the beacon at reasonable signal
levels. I hope that you have the right downlink freqs. 29.358 to
29.398. Signals at close satellite ranges should produce upto 5x5
signals from your receiver on a dipole.

As far as the upper beacon, I've never heard it so I assume its off.

Sorry can't help with the uplink part.

Good luck on the birds.

Well just having obtained WISP, I ran home and tried to install it and find that all runs well...until I try and run a Satellite Track, where I get a Floating Point: Divide By Zero error within windows...I followed the getstart instructions and modified/setup as per the text. I am running a 486/33 with 16 megs of ram and generic VGA, DOS 5.02, standard windows..

Any Ideas ??

Hi, Omri, thanks for your reply. I find that the Eggbeaters do fine for me. Both the 2M and 70cM antennas are up at about 20 feet, and separated about 25 feet. Right now I'm working AO-16 and LO-19 at 1200 baud. I'm using the PacComm TNC96NB/PSK-1 pair. The uplink is a Kenwood TM-2550A set at low power driving a Mirage B-108G amp/pre-amp. Any radio you can use for terrestrial or MIR can be used for the 1200baud sats. The downlink from these birds is PSK, that's why you need a special modem. Note that the modem simply attaches to the disconnect header inside your present TNC-2 or compatible. My downlink radio is actually a Kenwood TS-670 with a Down East Micro xvtr. Works great! To work these satellites you'll need a special software package; regular packet stuff just won't do. I use WiSP, a shareware program from AMSAT. This is Windows based, but there is also the DOS pair PB/PG. (If you use either, please register them. The procedes go to keeping the satellite program alive.) A PSK modem will also gives you access to FO-20 when it's in digital mode; it operates almost just like an earth-bound BBS with just a few parameter changes.
Hope this helps. 73 de Gary WA4YMZ Gary Rogers@dgc.ceo.dg.com

Omri, seems I answered your second question about getting on the digital birds, but completely forgot to answer your request for my opinion on the Eggbeaters. Sorry. Here goes: I like them. Understand that they're not the optimal satellite antenna, but if you're like me and don't have the real estate to put up beams, they're hard to beat. It's also really convenient not having to track, especially if your computer lacks the ports or horsepower to use a rotator controller. Unlike the claims, I do tend to get nulls at high elevations, but they're brief. Mine are up about 20 feet and fed with RG-213. My horizon seems to be about 15 degrees. I've got the groundplane kit on both, so local stuff isn't as strong. I'm using the M2 stuff and am happy with the quality. They're a bit pricey, but "you get what you pay for."

P.S. My apologies to those reading this multiple times. I sometimes get replies and don't know which posting generated them.

Hope that answers your question, Omri. 73 es hope to see you on the birds.

```
AMSAT.ORG Mailing List and Remailing Services
=============================================

revised: 10/31/94 kb5mu

AMSAT-NA (the Radio Amateur Satellite Corporation in North America)
operates the Internet host AMSAT.ORG to provide for efficient
communications between people interested in the amateur satellite
program. At this time two services are provided: a message remailing
service and a mailing list service.

In addition, the Internet host WWW.AMSAT.ORG provides interactive
access to a variety of information related to the amateur radio
satellite program. Use your Web browser program (e.g., Mosaic) to
access the URL <http://www.amsat.org/amsat/AmsatHome.html>.

Anonymous FTP is available on FTP.AMSAT.ORG. This archive contains
much of the same information as the WWW server. In addition,
various files and programs are available for anonymous FTP. To
access the archive, FTP to FTP.AMSAT.ORG, use the username
"anonymous", and give your email address as the password.
Look in the amsat subdirectory. This is a relatively new archive, so
the host FTP.UCSD.EDU still has lots of files not available there.

The message remailing service permits users to send each other mail
on the Internet without keeping track of each other's Internet
address. The remailing service allows each user to receive mail sent
to the address callsign@amsat.org, where callsign is that user's
amateur radio callsign, or other unique identifier. Mail sent to
that address will be routed first to the AMSAT.ORG host at UCSD in
San Diego, then remailed from AMSAT.ORG to the network address
specified by the user. In most cases, this process delays the
message by only a very few minutes.

The mailing list service groups subscribers into mailing lists to
receive certain types of messages. There are public mailing lists
available to anyone, and private mailing lists available only to
certain people (for example, AMSAT Board of Directors members or
PACSAT command stations). Currently the following public mailing
lists exist:

ANS AMSAT News Service

This mailing list carries official news releases from
the AMSAT News Service. These messages are posted in
a form suitable for direct posting to a packet radio
BBS system. Each message contains a Bulletin Identifier
```

(BID), which permits the message to be introduced into the packet network at many places without resulting in duplicate bulletins at any BBS. The primary purpose of this mailing list is to distribute ANS bulletins for redistribution (via the packet net or on AMSAT voice nets), but individuals may also subscribe for their own use. If your local packet BBS doesn't seem to get the ANS bulletins reliably, you are encouraged to post the ANS bulletins yourself.

Only authorized AMSAT News Service personnel should send messages to the ANS mailing list.

AMSAT-BB AMSAT bulletin board

This mailing list carries general AMSAT information. This information may NOT be suitable in content for transmission via amateur radio, so automatic reposting of AMSAT-BB messages to packet radio BBS's is discouraged. The purpose of this mailing list is to provide a forum for general discussion of any satellite-related topic.

Anyone may send messages to the AMSAT-BB mailing list. Simply address your message to amsat-bb@amsat.org, and it will be automatically forwarded to all subscribers to the AMSAT-BB mailing list.

Editors of publications should ask permission of the sender before publishing anything seen in AMSAT-BB elsewhere, unless the posting was obviously a public press release. However, posters should realize that anything posted to AMSAT-BB is essentially public.

KEPS Keplerian Elements mailing list

This mailing list carries official postings of Keplerian element sets for satellites of interest to radio amateurs. Like the ANS bulletins, these messages are posted in a form suitable for direct posting to a packet radio BBS.

Only authorized AMSAT News Service personnel should send messages to the KEPS mailing list.

NASAINFO NASA related information mailing list

This mailing list contains information about current and planned NASA space missions. Be forewarned: at times this mailing list delivers many large messages.

SAREX Shuttle Amateur Radio Experiment mailing list

This mailing list contains information and press releases pertaining to SAREX missions.

To obtain any of these services, just send a message to the address

listserv@amsat.org

This address may be reached from CompuServe MAIL as:

>INTERNET:listserv@amsat.org

For the moment, the maintenance of the AMSAT.ORG mailing lists and remailing aliases is done manually. Later, this service will probably be automated and you will have to follow a strict message format. For now, you may send requests in free format. They will usually be processed within a few days. In general, you will not receive an explicit reply to your request. Be sure you specify:

1. Which mailing list(s) you want to receive

2. Your callsign, if any

3. The Internet address to be used, if different from the one in your From: header.

You should not send messages about your subscriptions to any of the mailing lists. Send them to listserv@amsat.org instead. This includes questions, requests for changes, requests for information about mailing services, and complaints.

The list of amateurs who may be reached via the message remailing service may be obtained by requesting the "address book". Note that the address book as distributed contains only the callsigns of the available addressees, not their actual Internet addresses. The address book is updated occasionally, and does not necessarily contain the very latest information.

You may request to be added to the list, to be deleted from the list, or to have your Internet address changed on the list. Please include your callsign if you have one. If you don't have a callsign, that's OK, but please say so. If you have more than one Internet address you want to have available on the AMSAT.ORG remailer, you may so specify. For instance, if you have a regular Internet address and a CompuServe account, you may appear in the address book as both w1xyz and w1xyz-cis. Mail sent to w1xyz would go to your Internet address, and mail sent to w1xyz-cis would go to CompuServe. MCImail accounts have the form w1xyz-mci, and so on.

You may also subscribe or unsubscribe to any of the public mailing lists described above. Send a message to listserv@amsat.org, specifying clearly which mailing list(s) you want to add or drop, and giving your callsign if you have one. When you subscribe to a mailing list, you will automatically be added to the remailing service as well, because the mailing lists are maintained by callsign. If you have more than one address listed in the remailing service, please indicate which one(s) you want the mailing list messages sent to.

Additional mailing lists, public or private, can be set up as needed.
Send mail to listserv@amsat.org for details.

Questions about any service offered by AMSAT.ORG may be directed to
listserv@amsat.org as well.

Frequently-asked Questions and Complaints (and Answers):

1. Why do I get "MCI Mail Rejected a Message" responses each time I
send a message?

MCI won't accept mail from CompuServe via the Internet. This is just
corporate policy. There isn't anything we can do about it, short of
banning MCImail addresses from the mailing lists.

(Is this still true?)

2. Why did the mailing list messages suddenly stop coming to me a
few weeks ago?

Something may have been temporarily wrong with mail delivery to your
site. If a message to you bounces back to the list maintainer, you
may be removed from the mailing list without notice. If you think
this has happened to you, send a message to listserv@amsat.org and
ask.

3. I never get an answer from w1xyz when I send him mail via AMSAT.ORG.

If his mail isn't getting delivered, you *should* receive some kind of
automatic message indicating there has been a delivery problem. If you
don't get such a message within a few days of sending your message,
chances are that your message made it to the addressee's mailbox.
However, the addressee may be behind on reading email, or may simply
not bother to reply, and there isn't much we can do about that.

Another possibility is that the message you sent contains a bad "From:"
address. This will prevent the recipient from replying to your message.
If you suspect this may be happening, include your real Internet address
in the text of the message. If you find that this is happening, please
complain to your system administrator.

4. My computer says "unknown host" whenever I try to reach AMSAT.ORG.

This indicates a problem with domain name service. AMSAT.ORG *is* a
fully official domain name, and your host should be able to find it.
Check with your local network administrator (tell him to check the
nameserver at ucsd.edu). As a workaround, you may be able to use an
address of the form
callsign%amsat.org@ucsd.edu
to force the message to pass through the UCSD mail host on its way to
AMSAT.ORG. If your local system can't find ucsd.edu, you're in trouble!

5. I have an important announcement I'd like to make. Can I send it
to the ANS mailing list?

Not unless you're an official ANS station. You may send it to AMSAT-BB, and/or submit it to the ANS editor (wd0hhu@amsat.org) for possible inclusion in the next issue of ANS.

And no, the computer doesn't enforce this rule. You're on your honor.

6. I can't get Internet access!

Yes, you can. It may not be very easy or cheap, but you can. You have a number of alternatives:

* find a local connection. Most hams have inside connections they don't even know about. If you know somebody at the local university or at a high-tech company, ask them if there's any way for you to have access to the Internet through their system. Sometimes the answer will be yes. If you are in a position to grant access, *please* make this service available to local AMSAT folks.

* check with your local BBS. Some telephone BBS systems have access to a mail gateway that will allow you to send and receive Internet mail. This may not be the fastest way to receive the mailing lists, but it is probably the cheapest if you don't have free access.

* subscribe to a pay service. There are several systems that offer Internet access for a fee. CompuServe subscribers can find a list in the Internet library of the TELECOM Forum. AMSAT does not maintain a current list of public Internet providers.

* subscribe to a commercial service that provides Internet access. America Online, Genie, and Delphi are among such services. Check around to find the one with the rate structure that best matches the way you expect to use the system.

* subscribe to CompuServe. Many subscribers to the mailing lists receive their mail via CompuServe. This is an expensive choice, but it is very easy and available in most developed parts of the world. CompuServe is often a local telephone call, and they have an 800 number for people in the less-populated areas of the US. CompuServe starter kits are available at computer stores, and there's often one included free when you buy a modem.

CompuServe users can send mail to Internet addresses by adding
>INTERNET:
before the address. The ">" and the ":" are required, and "INTERNET" must be in uppercase. For example, to send mail to w1xyz, you can use the address
>INTERNET:w1xyz@amsat.org
from CompuServe MAIL. Note that there is no way to communicate between Internet and a CompuServe forum like HamNet. The Internet gateway only works for CompuServe MAIL.

There may be an additional surcharge for receiving messages from the Internet on CompuServe. As a CompuServe subscriber, your mail may also be subject to additional delays. Worse, CompuServe limits

the amount of mail you can have pending in your mailbox, so you must read your mail frequently. Check with CompuServe for details.

7. There's too much XYZ being posted to mailing list ABC!

It's not possible for the mailing lists to contain exactly what you find interesting. If we are to share information freely, all subscribers must be prepared to cope with a certain amount of traffic they find boring or useless.

Sometimes it becomes a clear problem, with one subject generating so much traffic that it becomes a burden on a more general mailing list. In those cases, a new mailing list can be created to make it possible for only those who are interested to receive the information. However, there is a practical limit.

8. I posted a message to mailing list ABC, and I got a bunch of bounce messages back.

Most automatically-generated problem report ("bounce") messages should be automatically routed to the list administrator. These messages usually signal a transient problem somewhere in the network. Often, the problem is at the receiving end. If a particular subscriber generates repeated bounce messages, that subscriber will be removed from the mailing lists.

If by some mischance a bounce messages comes back to you, the poster of a message to one of the mailing lists, please forward the bounce message (or a sample if many arrive) to listserv@amsat.org. Please forward the entire message including headers as received. If the echoed text is large, you may edit it down, but preserve all headers and bounce message text.

Do NOT forward bounces resulting from sending messages from CompuServe to MCImail. There's nothing to be done about that.

9. How do I get a password for AMSAT.ORG?

You don't. There are no user accounts on AMSAT.ORG. When you get an alias on AMSAT.ORG, that only allows others to send mail to you as yourcall@amsat.org. It doesn't mean you have an account on AMSAT.ORG.

10. How do I log in to AMSAT.ORG?

You don't. There are no interactive services on AMSAT.ORG.

11. Is there anonymous FTP on AMSAT.ORG?

No, there is not. But there IS anonymous FTP service on FTP.AMSAT.ORG.

12. Do I have to be a member of AMSAT to take advantage of the services of AMSAT.ORG?

No, the services are available to anyone. Of course, you're encouraged to join your national AMSAT organization.

13. Is there any charge for AMSAT.ORG services?

No.

14. Please send me info on AMSAT. Please change my mailing address or phone number on AMSAT's records. Please send me X.

The AMSAT office is separate from mailing list maintenance. You may address requests like these to martha@amsat.org, or send them by mail, phone, or fax to AMSAT headquarters:

AMSAT-NA
850 Sligo Avenue
Silver Spring, MD 20910

136. next shuttle flight carrying SAREX?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-22 02:59:33 UTC
From: jim@n5ial.mythical.com
Message-ID: <1995Jan22.025933.2659@n5ial.mythical.com>
Source record: 25833
Cross-posted to: rec.radio.amateur.space,sci.space.shuttle

NOTE: Reply-To set to a faster path to me...if your mailer doesn't like bang-paths, and you're replying via e-mail, jim@n5ial.mythical.com will get to me...just not as fast.

Does anyone know when the next shuttle mission carrying SAREX will be? I've been watching the newsgroups recently for information on this, and I keep getting conflicting information (first it was early February, then early March, and now the first thing I see on Spacelink says April).

Better yet, if anyone has a schedule of missions in 1995 that will carry any SAREX operations, I'd *REALLY* like to see that!

Thanks,
--jim

PS: e-mail replies preferred (and followups set to poster), since I don't get rec.radio.amateur.space at home, and my newsfeed that gets sci.space.shuttle has been having trouble (a few sites upstream) lately. I will, of course, try to keep an eye on both groups, either way. And if there is any interest, I will post a summary if I get any info.

The Jan 95 "The World of Ham Radio" CD-ROM newsletter is now available. This CD-ROM offers more ham programs than any of the others out there! Over 20,000 IBM files for amateur radio are stored on this CD-ROM. Included are the FCC CALLSIGN call book with US & Foreign listings current to 12/94, and AMCALL the new logbook from AmSoft that will auto log from the CD for you. Over 1,350 Radio Modifications. The latest HST, NASA & Space images. Over 700 Megabytes of Amateur Radio Software packed into 1 CD. This CD-ROM is published every 4 months without delay in JAN, MAY, & SEP.

If you would like to get a FREE newsletter about the JAN 1995 AmSoft CD-ROM please send your Internet E-mail address to: amsoft@epix.net

Why not look at using some of the popular data acquisition
hardware/software to record and analyze events? Files could then be
exchange using the Internet. Once a common storage location was
determined many people could analyze the same data and compare relults.
A/D converters are cheap and software is not hard to find.

Try to get SATTRACK. It can track satellites.

What's wrong with Basic?! I still use it regularly (oke, that's PowerBasic: a *real* programminglanguage).

>I am already aware of DOS-based programs that will do this.
>I just want to learn more about the techniques/math for myself.

If I remember correctly SATTRACK is a (Sys/User?)RPL program that was based on something for the PC written in C. If that's the case (I could be thinking about some other program here) then that sattrack.c source was included with the RPL program and docs. Maybe that should help?

I wrote fisheye and sked prediction programs for the HP-48 some
time ago. I sent them to AMSAT, where they were "filed". I still
have them in storage on my home PC. They are based on the NORAD
SGP algorithm described in Spacetrack Report No. 3, Models
for Propagation of NORAD Element Sets, which is available from
Department of Commerce
National Technical Information Service

5285 Port Royal Road
Springfield VA 22161

The HP-48 programs use an abbreviated version of the SGP tracker
but are still spectatularly accurate. Better than InstaTrack.

If you're interrested, send a 360K 5-1/4" floppy (realy, my PC
is a relic from a bygone age), plus self addresses, stamped
envelope, and I'll send you whatever I can find.

Possible contents:
HP-48 programs
PC program which parses 2-line NASA kep files into HP-48 kep files
Program Performance Spec describing the mathematics in WordPerfect

The versions that AMSAT may still have are in error. I have no
interest in communicating with AMSAT again.

I wrote some pretty impressive satellite tracking programs in
C, but they are the property of my employer. We are incorporating
them into larger weather and aviation software products, and
we have no plans to market them separately. Sorry.

Hello Everyone,

The W8YY Winter Carnival Special Event Station is being set up for
this year. As of now we are planning to operate W8YY for 24 hours
straight from Thursday Feb. 2nd until Friday Feb. 3rd. The times will be
from 6am Thursday to 6am Friday. The following frequencies will be used:
>From 6am to 6pm Thursday, 14.255 Mhz. From 6pm to 11pm Thursday, 7.255
Mhz. From 11pm to 4am Friday, 3.805 Mhz, and the last 2 hour will be held
on 7.255 Mhz again. We will also be monitoring 146.58 Mhz during the
operation period. Anyone wishing to contact us via Packet can log in on
144.09 Mhz to the MTUBBS. Certificates will be awarded to all stations
contacting W8YY during this period. Please send a large self
addressed stamped envelope, certificate sized if you don't want any
creases. The certificate is 8.5 x 11 inches.

Source record: 25847
Cross-posted to:
sci.space.shuttle,rec.radio.amateur.space,sci.geo.satellite-nav,rec.video.satellite.tvro,comp.windows.x.apps,sci.astro

Subject: SatTrack V3.0.1 Upgrade
January 23, 1995

Since the SatTrack V3.0 release a few bugs have been discovered by several users and by the author. One is a glitch in the calculation of the sidereal time. Another one is a potential zero divide problem in the graphics display section. These are fixed in the 3.0.1 patch. Other issues like the crashes that can occur on certain machines when the graphics display is turned off and back on again, and inconveniences related to the environmental variables DISPLAY and TERM will be fixed in the V3.1 release.

For now, the 3.0.1 patch needs to be installed on top of the existing V3.0 installation. The distribution file 'sattrack.V3.0.1.patch.tar.gz' can be obtained via anonymous FTP from ftp.jvnc.net/priv/kupiec/sattrack. As usual, place the distribution file into your UNIX home directory, 'gunzip' and 'untar' it. This will replace the following two files in your present SatTrack/src/sattrack directory:

satgraph.c
sattime.c

This procedure should not affect any customization of the code and its resource files. After installing the new files, type 'make clean' and 'make all' in the src directory.

SatTrack is a very complex program, and I'm trying to do my best to make it as user friendly and robust as possible on a variety of systems, but it apparently takes a few iteration steps. Stay tuned ...

Manfred Bester

Have you tried recently? The booster that carried RS-15 into space
blew up a few hours after releasing the satellite and the US Space
Command was tracking one of the pieces of debris instead of RS-15.
They are reported to be tracking the right blip on their screens since
some time last week. Try getting new elements and giving them a try.

Dave, N9LTD

Check out the latest edition of SPACENEWS (dated Monday Jan 23, 1995)
and use the keps that were generated by G3IOR. They are reported to
be accurate within +/- 5 seconds. You can contact SPACENEWS editor
at kd2bd@amsat.org, or magliaco@pilot.njin.net. Good luck !

While possible, FM voice operation will be strongly discouraged
on the Phase 3D bird, just as it is on Oscar 13 and Oscar 10.
Unlike previous satellites, there will be an automatic notcher
to prevent stations from running too much power.

Instead of using the bigger antennas and more powerful amplifiers
to accomodate a handful of FM users, SSB/CW users will be able to
get satisfactory performance out of the new satellite with modest
fixed beam antennas (100 watt+ bricks not needed). The orbit will
be such at it returns to the same spot in the sky every two days,
reducing the need for a $500 Az/El rotator.

There are 3 difficulties with FM, particularly if you need to
use 2 meters.

1. Finding the band space (less of a problem if you don't mind
using microwaves)

2. 100% duty cycle--virtually all satellites are power limited.

3. At low S/N ratios needed to accomodate lots of users FM is
at a significant disadvantage--probably by a factor of at least
4--so you probably need a solar array something like 12 to 20
times bigger.

Unfortunately, Satellite builders have to get the money
first--they can't build huge satellites first and pay for
them later. Thus, unless someone with very deep pockets
(your typical Billionaire) steps forward, I don't see
a Phase 3D FM voice satellite. Such a satellite would
probably have to use microwaves to avoid the political
problems of 2 meters--there have been squabbles over
FM frequencies for the Astronauts to use... 10 channels
isn't much if you cover the entire USA simultaneously.

The Meteor's have an "exposure-control". There are small b/w strips (not the synch) adjacent to the greyscale. This binary value corresponds to the opening of the iris. Sometimes ("sudden" bright clouds) there is a little fluctuation in the brightness, exspecially on the darker parts of the orbit (prior to switching off in darkness).

What we offer on the Internet is "A FREE HAM NEWSLETTER" and nothing
more. The purpose of the newsletter is to inform the interested
Amateur Radio public that our product will provide them with useful
information about the hobby of Amateur Radio. The decision for
another individual on the Internet to receive a NEWSLETTER is the
readers decision, not yours. My post gives the reader the choice
if they wish to continue by requesting our newsletter. In the case
of yourself, you did not need to respond.

The ease of posting Usenet News articles causes many inappropriate
articles to be sent to the network.
An article can be inappropriate if it:

-- Is devoid of useful information or ideas.
-- Is sent to inappropriate newsgroup(s).
-- Is really intended for a particular individual,
rather than the entire Usenet community.
-- Contains rude or insulting remarks.

Articles should be composed thoughtfully. Consider sending an
electronic mail message rather than posting an article, if
appropriate. Be aware of the fact that many sites must pay long-
distance telephone charges to receive your article. Also be aware

of the fact that some of the popular newsgroups have tens of thousands of readers. 10,000 people each reading your article for 20 seconds spend a total of 55 hours reading your article. At the end of most articles there is usually a small blurb called a signature or sig. This usually comes from a file in the person's login directory and is appended automatically to the message by the news reader. Some people get carried away with their signature and place complex ASCII drawings or cute sayings at the bottom of their messages. These signatures bother most people and it is considered poor "netiquette" to ave signatures larger than about 4 lines. Please remember to save your signature file as plain ASCII text, since vendor dependent binary files (such as Microsoft Word files) are not portable across the entire Internet community.

Many new users wish to test their ability to post before they actually say anything of any interest to anyone. Don't post test type messages to an active newsgroup. This will interrupt quite a number of people and is considered poor "netiquette". There are usually a number of "Test" newsgroups (they usually have the word "TEST" in their name) that can be used to verify that posting from your host will be successful. Some test newsgroups (like ALT.TEST) have automatic E-Mail responding software. A post to those groups will cause electronic mail from all over the world to be sent back to you as your post gets forwarded from site to site.

The "Newsgroups:" line in a news header isn't limited to just one group. If a note makes sense to more than one area you can cross-post it to other newsgroups by just separating the newsgroups with a comma on the Newsgroups line. It is considered poor "netiquette" to cross-post to more than several newsgroups.

When posting new articles to News, please remember that News runs on many different hosts and operating systems. The majority of posts from the Usenet are viewed by people running non-DOS/Windows operating systems. Inserting graphics or non ASCII text (such as different fonts, underlining, color changes etc.) in an article will appear as unintelligible garbage to almost everyone else. When responding to articles, use the Follow-up Article option instead of the New Post option. This will maintain a reference link between your message and the article you were reading at the time of your posting. People reading your message from other "thread based" news readers, will be able to understand how your message fits into the rest of the conversation. Intersperse your comments between the quoted text and delete any large quoted sections that do not pertain to your response. Someone can always find the original text by clicking on the unique Message ID. Also, use Message ID's when referring to other articles and never refer to another article by it's article number. Article Numbers are never the same from system to system so only people reading news on your own local system will know to which article you are referring.

Try to keep your text in a generic format. Many (if not most) of the people reading Usenet do so from 80 column terminals or from work-stations with 80 column terminal windows. Try to keep your lines of text to less than 80 characters for optimal readability. If people quote part of your article in a follow-up, each line gets indented a few characters and gets proceeded with a ">". Thus, standard lines of 75 characters or less are best for later readability. Be careful when using proportional style fonts since they allow you to place more characters per line than fixed style fonts.

Last but not least BOB, your suggestion that persons should be asked to CRASH MAILERS WITH ELECTRONIC FECAL MATTER will be met with a strong challenge here at EPIX.NET!
Should such an occourence happen we will refer the matter directly to your commander, you are under the Uniform Code of Military Justice!
Furthermore any damages caused by your suggestion will be dealt with in a court of Civil Law.

Hi John,

-> I was told that there was a FM sattelite that one could use with
-> something as simple as a dual band tranciever in the mobile.
-> I know that the new Phase 3D bird will do this, but I was told that
-> there is already a bird up there that does this part time.

Yes this is a bird that has a part time FM transponder. It is supposed
to be on, on weekend (AO-27, uplink 145.850 MHZ, downlink 436.800 MHZ),
but as of late, it has not been on or heard. Word has it that this bird
is under new management (probibly not HAMS). Who only knows when they'll
turn it on....soon I hope!

Good Luck and C U on the birds

Yep, the best I have found are 11 minutes slow for AOS. All the updates appear to have the same error. There were some TLE's on this group a few weeks ago that had been tweaked to work, but produced a checksum error when I tried to autoload them into Instantrack.

I find your (AMSOFT) reply as innappropriate, perhaps more innappropriate, than Bob's comments, and a substantial waste of "bandwidth".

Perhaps what Bob should have said is that it is contrary to Internet's policy for Internet to be used as a vehicle for commercial advertisement. That is a fact. While I can not say that the policy is a legally binding one (that is for others to say), it certainly is followed by the vast majority of commercial enterprises, and for good reason. They realize that they run the risk of alienating potential customers who may not appreciate such a blatant disregard for net etiquette and policy. Like Bob. And like me. Mind you, it is no big deal to me personally. But I don't like advertising here either, and there are plenty of alternatives to AMSOFT.

You seem to be aware of some internet policy judging from your long quoted (though not attributed) "lesson" to Bob. Perhaps you would find a more complete review of policy personally enlightening as well as commercially "prudent".

Greg Brown

163. Help -- where is GPS newsgroup??

Newsgroup: rec.radio.amateur.space
Date: 1995-01-26 05:05:40 UTC
From: gary_mart@bendnet.com
Message-ID: <3g7aj4$i3s@news0.rain.rg.net>

There were two. Now there is one or none. The first was
AO-21 but it is no longer operational. The other is AO-27.
It is a satellite that is sometimes on commercial frequencies
and sometimes on ham bands. It used to be on ham on weekends
and when the satellite is in sunlight. I haven't heard
much talk about it recently. The uplink is 145.85 FM and the
downlink is 436.80 FM.

I don't know Larry but this last Sunday (1/22) I got a perfect 12 minutes
of NOAA 14 APT. Best I've ever gotten from any NOAA's. - Chris

Hi there guy,
Just wanted to drop you a line and see if this BBS flows as fast as some of the others. I have been waiting for my new communications program and now that I have it I am looking forward to being able to write more often and to more people.

Hope all went well with the after party and there wasn't much clean up for you guys. I hated to leave so abruptly but when my other girlfriend showed up I figured we didn't need to get into it there. Please forgive me.

We will be down at Seaport Village all weekend if yo want to drop by and say hello, otherwise I'll see you at the Superbowl Party and this time no girlfriends!!! C'ya

>A/D converters are cheap and software is not hard to find.

To be meaningful, Tim, the data must preserve the phase information
of the signals. The idea with many small receiving sites is to combine
them coherently so that a much larger aperture is synthesized. This
allows signals that would be buried in the noise at a small receive
terminal to be resolved by use of correlation with the signals received
by other small terminals. It also allows a much narrower effective
beamwidth to be synthesized from the data, and allows that narrow
beam to be scanned across the heavens. That doesn't have to happen
in realtime *if some method to preserve the phase information is used*.
That requires a common time reference, a common down conversion oscillator
reference, and a data capture method that doesn't destroy the phase
coherence that has been so carefully preserved. The "popular" PC data
acquisition hardware/software doesn't do that.

There are ways to accomplish the goal fairly inexpensively, but they
don't use unmodified off the shelf items. A geosync TV sat can be
used as a timing and frequency reference for the radio astronomy
terminal via a modified TVRO setup. Temporary storage of a 3-4 MHz
chunk of spectrum can be done using a modified VCR. And a coherent
sampling system feeding a PC can convert the data on tape to digital
in non-realtime in the same way that frame grabbers get a still from
a TV picture. By repeatedly playing the tape, the signals can
eventually all be converted into digital form for transmission to a
central site. The amounts of data involved would be *huge* for even
a short duration receiving session, however. Using an 8-bit sampler,
about 80 megabits/sec of data would be generated for a 4 MHz wide
chunk of spectrum. And that would have gaps of about 15 uS every
63 uS. (Using professional grade recorders, and CTDM, the gaps
could be eliminated, but that would be cost prohibitive.)

What would make this an interesting project is that the radio
astronomy terminals could be operated in the upper HF spectrum,
using simple wire dipoles. A continent wide array of such terminals
could offer a synthesized aperture that could be easily "steered" in
non-realtime by the data correlation software. Right now, fine
resolution at HF is impossible for existing radio astronomy
sites. Thus, amateurs could make a real original contribution
to the science.

>times bigger.

This is probably true in the limit case, where the passband is
filled completely, and operations are at the limits of detectability,
but that hasn't yet been the case with amateur satellite operations.
Typically, signals are in the range of 12-20 db SNR for amateur
operations on P3 birds (AO-10 and AO-13). To achieve a similar
SNR for FM voice, the CNR can be lower due to the FM threshold
effect. CNR and SNR are identical for amplitude modulated signals
such as keyed CW carriers and SSB voice, but they are not identical
for FM voice. (I'd note, however, that to get significant threshold
improvement, a higher modulation index than is typically used in
amateur terrestrial operations would be required.)

P3D will have a power budget about 10x that of AO-10 and AO-13,
yet both of those satellites have been able to support FSK and
SSTV operations, both high duty cycle modes. Limited FM operations
should be possible on P3D without significantly impacting the
power budget.

This is an offer for a private newsletter which is an advertisement, right?
An offer to subscribe to advertising is, IMHO, an advertisement in its
own right. The real crux here is the motive behind your postings--it's to
market a product, plain and simple. As far as responding via private e-mail,
well, I hope that my postings will prompt others to complain about what you
are trying to do here. If we let you get started, then we may as well open
the floodgates net-wide. Wouldn't that be a pretty sight--junk e-mail by
the megabyte...

Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amate

I recently posted a reply to the AMSOFT spam telling them that
instead of asking for a copy of their thinly disguised advertisement
for their CD-ROM, I was sending a copy of their message to their
system administrator.

I sent that message to all the newsgroups AMsoft spammed because most
everywhere their original message went, there are people talking about
burying the instigators under a deluge of email. This will clog the
network and may well cause the people doing it to lose their access.

As I said in the message, the thing to do is to send a message
to their system administrator, which I did, with a copy to AMSOFT.
(The ALL CAPS warning not to send me their ad was to prevent them
from sending me more of their junk mail because of that copy.)

I presume that most people already know this, but a cursory review of the
responses to their luncheon meat attack shows that a lot of people don't.

To repeat (and clarify), the proper response to any kind of spamming
and especially to a _commercial_ spam is to send a copy of the
message to the miscreant's system administrator along with a note
describing the problems they're causing. This is almost always
effective, whereas a reply to the newsgroup just wastes bandwidth and
an email attack will just get the sender in trouble.

Dave Mullenix, N9LTD

176. Balloon FAQ 1.0

Newsgroup: rec.radio.amateur.space
Date: 1995-01-28 23:32:05 UTC

Message-ID: <3gek5l$9os@news.doit.wisc.edu>
Source record: 25876

I don't think a ham balloon FAQ has been written so far. I wrote this for the Wheaton Illinois Hamfest (Jan 29, 95) and thought I'd post it too. It's nowhere near complete, but it's all I've got so far. Comments, additions and corrections are welcome.

BEGIN --- CUT HERE --- Cut Here --- cut here ---

Ham Ballooning FAQ
or
"What little I know about ham ballooning, by N9LTD"

This is mostly stuff I learned from Joe, WB9SBD, who got me into this mess. I've chased a half dozen of his Near Space Science (NSS) balloons, helped him launch several of them and balloonmeistered two launches for the High Altitude Radio Project (HARP). This is version 1.0 of the FAQ, so please excuse any mistakes or omissions.

THE MOST IMPORTANT RULE

Rule #1 for those interested in getting into ham ballooning: Join a group that's already launching balloons to learn the ropes. I can't tell you everything you need to know in a FAQ. Don't try to learn it all yourself by trial and error, learn it from someone who's actually doing it! Start by volunteering to chase the balloons. Chasers are ALWAYS welcome. Special DF equipment is not necessary. There comes a point in every flight where the balloon is laying on the ground and its range is so short that nobody can hear it. That's when lots and lots of people are needed to drive around until they pick up the signal. Once the balloon can be heard, people with DF gear can start tracking it down. Balloons often land in trees and marshes, so hunters and tree climbers are always welcome on chase crews. Bring your hip boots.

Then help with a few launches. See what's involved in filling and launching a weather balloon. Get a look inside the payload box to get an idea of the construction required.

Then find out who in the FAA the group contacts when arranging flights. The regional FAA office will probably have one person who handles most of the ham flights and he will be MUCH more comfortable with your request to launch if you tell him you've been working with a group that's had several safe and successful flights and are following their procedures.

Here's a list of what our group has been using for ham balloons and where we find what we need. As I said above, I got most of this information from WB9SBD.

BALLOONS

We use Totex weather balloons. They seem to be the best quality. We purchase them from:

Kaymont Consolidated Industries, Inc.
21 Sprucetree Lane
P.O. Box 348
Huntington Station, NY 11746
Phone (voice): 516 424-6459
Phone (fax): 516 549-3076

Balloons are sized by their weight in grams. Kaymont currently carries two sizes, 800 and 1200 grams. The 800 gram size will lift 3-4 lbs to 100,000 feet. The 1200 gram size will take a full six pound payload to 100,000 feet. Prices are about $45.00 each for the 1200 gram balloons. Kaymont accepts telephone orders and credit cards.

BATTERIES

Only one type of battery will do: lithium. Nothing that is available on the commercial market approaches lithium's power per pound. We normally purchase military surplus lithium battery packs. They contain 10 D cells in a series/parallel arrangement that produces 15 volts. The packs come apart very easily into two 5 cell strings. The D cells themselves are connected with welded tabs that can be easily cut and soldered into whatever voltage and amp/hour combination you need. The D cells are 3 volts each, so 3 will give you 9 volts, 4 will give 12 and 5 cells will give 15 volts. The cells in the battery packs will typically be out of date, but lithium cells have an excellent shelf life and we've never been disappointed. You can expect 6 AMP hours from each 3 volt D cell.

I connected a single 3 volt lithium D cell to a 10 Ohm resistor, put a Radio Shack RS-232 VOM (lent by Don, K9LYE) across it and let my computer log its progress. The voltage _rose_ slightly for the first half hour to 2.81 volts and it then stayed there for 22 hours before it started to drop! It didn't drop to 2.5 volts until 24 hours after starting the test. I put a 5 ohm resistor across a second D cell and the voltage stayed at 2.78 volts for 12 hours. That's 6000+ mah per cell! A 5 D-cell pack will provide about 3.3 watts for 24 hours or 6 watts for 12 hours. You really need about 12 hours of capacity. That gives you four to six hours for the flight and another six hours to recover the payload when it lands.

Here are our results for various resistances across a single 3 volt lithium D-cell:

Life Watts Watts
Peak Peak in per per
Ohms Volts Amps Hours cell 5 cells Notes
10 2.8 .28 24 .78 3.9 (Lifetime measured to 2.5 V)
5 2.78 .55 12 1.53 7.6 " " " "

3.3 2.75 .82 8 2.25 11.2 " " " "
2.5 2.71 1.08 6 2.92 14.6 " " " "
0.77 2.46 3.20 2:14 7.87 39.4 (Lifetime measured to 2.0 V)

(That 0.77 ohm load was a mistake. I thought I had 4 10 ohm / 10 watt resistors in parallel. One of them turned out to be 1 ohm. Boy, did it get hot!)

We order our lithium batteries from:

S & G Electronics
618 S. 62nd St.
Philadelphia, PA 19143
Phone (voice): 215 474-7663

Prices run around $15.00 per pack of 10 cells.

S&G accepts phone orders, but not credit cards. They will ship C.O.D., however. S&G is a real mom and pop outfit and very nice people to do business with.

GAS

We use Hydrogen because it's cheaper (about $20.00 per cylinder versus $40.00 for helium) and has more lift. Also, we're not too bright. Hydrogen has two drawbacks: it burns and it explodes. On the other hand, it's not super vicious. Your balloon will be delivered with no air in it. Don't let any get in while you're filling it and the hydrogen can't explode in your balloon. If the balloon bursts while filling it indoors, get out and let the hydrogen dissipate for a while. Don't flip the light switch on the way out. Try to do your inflation in an old, leaky building just in case the balloon pops. An old barn with lots of holes in the roof is ideal for working with hydrogen.

Buy hydrogen (or helium) at any welding supply shop. You will need the biggest tank they have, size K or T, which will typically come up to about your shoulder. Put another way, it will just barely fit into the back seat of a Ford Taurus. Try not to get into any accidents when you have a tank full of high pressure hydrogen in your back seat. In the event of a serious traffic accident, you needn't worry about being injured. You will die.

Either size tank will fill a 1200 gram balloon with gas left over.

You should have a regulator for your tank to lower the 2000 pound plus pressure to a few pounds, although in an emergency you can tape the filling hose to the outlet of the tank and then open the valve _very_ carefully. I've seen it done, but I don't recommend it.

You can rent regulators at the same welding shop you buy your hydrogen at. If they don't have hydrogen regulators, you can use a nitrogen regulator with a $15.00 adaptor the welding store can sell you. Helium is used a lot, so they will probably have helium

regulators in stock. ARRANGE FOR YOUR GAS PURCHASE AT LEAST TWO WEEKS BEFORE FLIGHT. The welding shop may need time to do a credit check on you. If not, they will require a $50 - $100 deposit on the tank. You have to rent the tank, they won't sell it to you. Regulators typically rent for about $5.00 a week. You'll also have to rent the tank at about a dime a day. The welding shop will give you a hazardous material form that MUST be carried in your vehicle at all times the gas tank is on board or you are liable for a multi-thousand dollar fine.

INSTRUMENTATION

The best instrumentation is a GPS receiver sending its data to a packet TNC and a transmitter. This will send you the balloon's latitude, longitude and altitude. They're wonderful! Note, however, that many GPS receivers won't work above 60,000 feet. This is because of export regulations designed to keep Saddam Hussain or somebody like him from using a GPS receiver to improve the accuracy of a Scud missile. The actual regulations ban export of GPS receivers that can measure speeds in excess of several hundred miles per hour at altitudes above 60,000 feet. Motorola GPS boards are reputed to work above 60K feet at typical balloon speeds. Most manufacturers can provide you with versions of their firmware that will work above 60k feet, but you will have to sign a non-export agreement.

Note also that the accuracy of GPS signals is purposely degraded to about 100 yards horizontally and 300-500 feet vertically to keep Russian ICBMs from using them to achieve the +/- 10 yard accuracy necessary to take out a hardened missile silo. This will make your readings, especially altitude, jump around a bit.

Make sure your GPS receiver has a NEMA output. This is a 4800 baud RS-232 ASCII output in a standardized format. It was originally designed for use on boats, to let things like LORAN receivers work with autopilots. If the GPS receiver can be programmed to send lat, long. and altitude every minute or so, you can connect this output directly to the TNC input and let her rip. APRS programs are designed to handle this data format. However, if the receiver sends its data constantly, you will have some overflow problems feeding a 1200 baud TNC.

CHEAP ALTIMETER

Thanks to Kevin, WB9YHB, we now have a cheap electronic altimeter. He spotted a Microswitch pressure transducer in a MECI surplus catalog that provides a 1 to 6 volt output that is linearly proportional to pressure. The catalog blurb:

PRESSURE TRANSDUCER Absolute pressure sensor for 0-15 PSI range. 45PSI maximum overpressure with 0.333 volts per PSI sensitivity, .75% linearity. Three wire PC mount. Mount holes 2-1/16 O.C.

Includes spec sheet. Mfg: Microswitch Mfg P/N: 142PC15A
MECI PART NUMBER: 540-6206F

It's a whopping $2.95, unless you order 10 or more when it drops to $2.50 ea. It's small, light and runs off 8 to 12 volts. It only requires one resistor. I ordered ten of them in Dec, 1994 and they had about 700 left. Hurry and get yours now. :)

MECI

CHEAP FLIGHT COMPUTER

Computers don't come much cheaper than Parallax's BASIC Stamp. This $39.90 device is a printed circuit board the size of a large postage stamp containing a microprocessor, 256 bytes of EEPROM, 8 programmable I/O lines and a 5 volt regulator. One end of the board has a pair of sturdy clips for a 9 volt battery, which will run a STAMP for several days. Small as the board is, half of it is a prototype area containing a 10 x 14 array of isolated plated through holes for your circuitry.

The Stamp has a 4 MHz clock and comes with a built in Integer BASIC interpreter. You write your BASIC program on a PC using Parallax's special BASIC editor and then download it to the Stamp's EEPROM with a cable that connects to your parallel port. (Don't know if a Mac can use the BASIC Editor when running a PC emulator.) The program starts immediately and it restarts every time you connect power afterwards.

Each of the 8 I/O lines can be independently programmed as a TTL/CMOS compatable input or output. An output pin can source 20 ma and sink 25 ma. Each pin can also be an RS-232 input or output at speeds up to 2400 baud. (Note, the output is 0-5 volts, which isn't _true_ RS-232, but it works with everything I've tried so far.) The inputs work fine with standard RS-232. The "RS-232 interface" consists of a current limiting resistor.

Parallax's application notes show how to connect an ADC0831 8 bit analog to digital converter chip to the stamp. This is an 8 pin chip with a serial interface that connects to the Stamp with just 3 wires. We currently use two of them and two Radio Shack thermistors (p/n 271-110) to read inside and outside temps. The data is sent to the ground by Morse code, also generated by the Stamp. My next generation board will use a ADC0838 chip, which has 8 inputs. The Stamp also has a Radio Shack reed relay mounted on it which snaps pictures with a 35 mm camera after every ID. The 831s and 838s are available from Digi-Key.

A Cheaper Flight Computer

Parallax has actually found a way to make a BASIC Stamp for even less money! The BS1-IC is a 1.4 x .4 inch PCB with surface mounted parts and 14 pins sticking out of one side so it can plug into a socket like a SIP. (Single Inline Package) It contains EVERYTHING a standard Stamp has except the 9 volt battery clips and it's only $29.95!

A More Powerful Flight Computer

Parallax is promising the Super Stamp (or Stamp II as they call it) in Feb 1995. (It was originally promised for Nov 94.) This is another surface mount board, with the form factor of a 24 pin DIP. It will have 16 I/O pins, a 20 mhz clock, 2k EEPROM, 9600 baud RS-232, DTMF encoding and decoding, built in A/D and more. Time will tell if they deliver it all. The price is to be $49.95.

Parallax BBS and FTP site

The Stamp manual, application notes and programs are available on the Parallax BBS at (916) 624-7101 or by anonymous FTP from PARALLAXINC.COM

Avoid the BASIC Stamp Programming Kit

Parallax will be happy to sell you a BASIC Stamp programmer's kit for $99.00. It contains a cable to connect the Stamp to your PC's parallel port, a manual, a set of application notes and a disk with software. The manual, application notes, software and pin out for the cable are available for free download on their BBS and FTP site. On the plus side, the programmer's kit comes in a really neat cardboard box, which I've gotten a lot of use from.

PINOUT for the PARALLEL PORT to BASIC STAMP CABLE

DB 25 BASIC BS-1C
Connector STAMP (Stamp SIP)
2 3 5
11 2 4
25 1 <<< 3 (GROUND - Marked <<< on Stamp)

All of the BASIC Stamp products are available from Digi-Key or you can order from Parallax at (916) 624-8003.

35mm CAMERA

What's the world look like from 100,000 feet? A camera can tell you. A few 35 mm cameras can automatically snap a picture every ten minutes, but we couldn't find one. Next best is triggering a camera electrically with a reed relay driven by a BASIC Stamp output pin. We use a "Canon Sureshot esprit".

If you remove the bottom screw nearest the tripod hole, you can remove a small plastic plate that uncovers a flexible printed circuit board. If you hold the camera upside down with the lens facing away from you, you will see a horseshoe shaped ring of circular solder

pads with one pad missing at the top. Number the pads counterclockwise starting with the pad to the left of the missing pad. Short pads 1 and 3 together and run a wire from pin 1 and pin 2 to the normally open contacts of the reed relay. Close the relay contacts for 1 second and you'll take a picture.

NOTE: You will have to either use wire thin enough so that you can replace the plastic plate or you'll have to cover the hole where the plate was with black electrical tape. If you don't, a light leak will fog one corner of each picture.

Which way to point the camera? Well ... if you point it down, you get great aerial photographs of the earth below you. It's a lot of fun spotting familiar places and just plotting the balloon's course after the flight by finding landmarks on the pictures. On the other hand, if you point the camera horizontally, you get some magnificent photos at high altitude. Your balloon will go so high that the sky will be black and you can see the curvature of the earth on the horizon. Your choice, I guess.

BASIC BALLOON CONSTRUCTION

The basic balloon setup is one weather balloon, five to ten feet of 50 lb test cord, one parachute tied to the cord at its apex, another five to ten feet of cord tied to the parachute shroud lines with a radar reflector attached to its middle and the payload. You HAVE to have the parachute and radar reflector - FAA regs. Ditto for the 50 lb (max) cord.

RADAR REFLECTORS: We now know for certain that just hanging a space blanket from the package won't work. They barely show up on FAA radars. Best bet: a styrofoam corner reflector covered with space blanket material. Look in a boating catalog for models. Hints: forget aluminum foil, it's too heavy. Ditto for cardboard. Space blankets (very thin aluminized mylar) work fine and are featherweight. Get them from sporting good stores.

Payloads

REDUNDANCY! Live by that word! Have at least two transmitters. Each transmitter should have its own, totally separate power supply. If your package isn't transmitting when it lands, you aren't going to find it. One transmitter can be a milliwatt rig running from a 9 volt battery. Hint: you can buy oscillator modules from Digi-Key for a few bucks each that have frequencies in various HF ham bands. They run on five volts and draw next to no power.

It gets down to 60 below zero Fahrenheit at 40,000 feet. An insulated package is necessary. A styrofoam beer cooler is light, cheap and a great insulator. If it's well sealed, things will stay quite toasty inside. Our lowest inside temps have been about 32 F. with a leaky package (lots of antennas sticking out through holes that weren't sealed with goop) to about 70 F. with very tight

packages. Our HIGHEST internal temp was 132 degrees F with a very tight package containing two transmitters that used a total of about ten watts from two battery packs. Remember, about 1/2 of all the power your transmitter draws stays inside as heat.

Put an audio beeper on the outside of the package. This will help you zero in on it if it lands in dense brush or woods. MAKE SURE THE BEEPER CAN BE TURNED OFF FROM THE OUTSIDE AND PUT PROMINENT INSTRUCTIONS FOR DOING SO ON THE OUTSIDE OF THE PACKAGE! We had a farmer find our package and take it back to the farmhouse. The beeping was so annoying that he put it in a metal granary to muffle the sound - and the signal we were tracking went to zip! Luckily, we had our address on the package.

PUT YOUR ADDRESS AND PHONE NUMBER ON THE OUTSIDE OF THE PACKAGE! Mention a $50.00 reward to the finder. So far, we've had one package found by duck hunters, who promptly switched the transmitter off. A second package wound up in a metal granary and a third had its single set of batteries die on the way down. (Remember what I said above about trial and error? These are some of the errors.) We got all three back because people found them and called us.

DON'T PUT AN ON/OFF SWITCH FOR THE TRANSMITTERS ON THE OUTSIDE. You WANT that signal to stay on so you can track it down!

Put "HARMLESS HAM RADIO TRANSMITTER" on the outside. After all, many people get concerned when a package bristling with antennas and going "BEEP BEEP BEEP" parachutes into their bean field.

The Federal Aviation Administration (FAA)

Unmanned Free Balloons are covered under section 101 of the Federal Aviation Regulations (FARs) along with Moored Balloons, Kites and Unmanned Rockets. Call your local control tower and they will mail you a copy of this section. Be prepared to play some telephone tag.

NOTIFYING THE FAA: The FAA wants to know about your flight at least one week in advance. If this is your first flight, call them a month in advance and talk things over with them. You will typically want to call the local "Center". Here in Wisconsin, we call Chicago center. If you can't find their number in the yellow pages, under Department of Transportation, try calling the local airport control tower. Be prepared to play some telephone tag. If other people in your area are flying balloons, ask them who they talk to and get the number from them. (See The Most Important Rule above.)

The FAA center will want to know when you intend to launch, where from (distance and direction from a town on a map), how high you expect to go and what direction you expect it to travel in. This last part can be hard to answer a week in advance, but generally it will follow the prevailing winds in your area. Here in Wisconsin, we always guess that the balloon will travel to the south east. You should also leave your number in case they have questions. If the

person you want to speak to isn't in, be sure to leave your name and number so they can get back to you.

24 hours before launch, you have to call your local Flight Service Station (FSS) and file a Notice to Airmen (NOTAM) giving the launch site, date and time, expected max altitude, expected rate of climb, expected direction of travel and landing spot. Your local FSS will have an 800 number. These people can also give you the winds aloft if you ask. Most pilots have no use for winds aloft over 30,000 feet, so tell the FSS that you're launching a balloon and ask for wind speed and direction for as high as they have data for. This will typically be about 50-60 thousand feet. Try to get the winds aloft for a reporting station to the west of you because 24 hours later, those winds will have likely moved to your location.

Call FSS the morning of the launch for current winds aloft. You can then get a pretty good idea of where it's going to go so your chase crew can position themselves accordingly.

Call the FSS as soon as you launch and give them your estimated climb speed. They probably won't need to hear anything else from you until the balloon goes above 60,000 feet. Once above 60k, you're in uncontrolled airspace and the FAA doesn't have to worry about you, so tell them when you pass 60k. Call them again when you descend below 60k and when you land.

The Launch Mechanics

First of all, you need to know how much gas to put into the balloon. What you want is enough gas to lift the balloon, your payload, radar reflector and parachute plus six ounces to one pound of extra lift. One pound of extra lift will give you about a 1000 foot per minute initial rate of climb. This will give you about a 2-3 hour ride to 100,000 feet. On a very calm day with slow winds aloft, you can put in six ounces of lift and get a longer trip up and more usable time at high altitude. Here's the WB9SBD method of achieving the desired amount of lift:

1: Construct a simple scale by suspending a strong rod from a rope tied around its middle.

2: Hang your payload, parachute, radar reflector, suspension cables and EVERYTHING else that will fly EXCEPT the balloon to one end of the rod.

3: Hang a one or two gallon plastic jug from the other end of the rod.

4: Fill the jug with water until the rod is balanced.

5: Add six ounces to one pound of extra weight to the payload end. (Hint: bread comes in one pound loaves - a WB9SBD discovery)

6: Add enough water to balance the rod again.

You now have a jug of water that weighs exactly as much as what your balloon will have to lift plus 6 to 16 ounces extra.

FILLING THE BALLOON

Fill the balloon indoors or in an area that's very well protected from the wind. You don't want to have to fight the wind because the balloon is very fragile and it will burst. Look for an old barn or airplane hanger. Be aware that the balloon will just barely clear a barn door when it's filled. A home garage door isn't high enough.

Spread a tarp on the ground to protect the balloon and spread the balloon out on the tarp. Handle the balloon with gloves.

Lay the gas tank next to the balloon. (It can't fall over if it's laying on the ground.) The regulator manufacturers recommend that you crack the valve slightly to blow out any dust before screwing on the regulator. Be aware that the threads on hydrogen tanks are "backwards" - you turn them counter clockwise to tighten them. (This gave me a bad moment on my first solo launch.) Run a hose from the regulator to your filling adaptor.

THE FILLING ADAPTOR: This is a piece of plastic tubing wide enough to be a snug fit into the open end of the balloon - 1.5 to 2 inches should do it. PVC pipe is fine. Somehow neck the other end of that tube down to the point where you can attach the hose from the gas tank to it. Also put a hook on the tube - perhaps by epoxying a piece of coat hanger wire to the side of the tube, near the end where the hose attaches. Now tie some twine from that hook to the jug.

Start the gas flowing and the balloon will start to inflate. Try not to get any air into the balloon, especially if you're using hydrogen! When the balloon lifts off the ground, the jug of water will keep it from going anywhere.

Continue to fill the balloon until the jug _just_ lifts off the floor. You now have enough gas in the balloon to lift your payload, parachute, radar reflector and connecting cords plus the extra six to sixteen ounces of water you put in the jug.

Sealing the balloon: using heavy twine, tie the balloon neck off tightly above the filling adaptor. Remove the adaptor. Tie the neck again, four to six inches below the first piece of twine. Tie your payload cord to the neck between these two pieces of twine. Now bend the neck over double and tie it again, twice. You will now have the neck of the balloon bent over double, with the payload suspension cord nestled in the bottom of the bend and the whole thing securely tied. You're ready to launch. (You can use tie-wraps instead of twine if you wish, but they're heavier.)

IS EVERYTHING TURNED ON?

Check now! Is your transmitter transmitting? Can you talk through the repeater? Is your GPS sending data? Is your audio beeper

beeping? Is your IDer IDing? It's best to have a checklist because you will feel _very_ foolish if you launch with something turned off! (Don't ask me how I know this.)

The Launch

Take the balloon outdoors with somebody else carrying the payload and parachute. Stretch the payload out downwind from the balloon, with somebody holding it. You can then just release the balloon or let it out hand over hand until you're holding the payload, then let go. It's best if people hold the payload, parachute and radar reflector to keep them from being dragged along the ground. Now call FSS and let them know you've launched.

The End

Oops, deadline's up and this has to go out. I remind you once again that this is version 1.0 of the BALLOON FAQ. I promise you that I've left things out and made mistakes. If you have additions, corrections or criticisms, please send them to:

177. AMSOFT-commercializing the net?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-29 07:26:27 UTC
From: bob@texas.net
Message-ID: <3gffv3$4o@empire.texas.net>
Source record: 25877

Hi;
I recieved this lovely little note from Pete deVolpi at amsoft. You read it and decide if this looks like a noncommercial entity publishing a noncommercial newsletter, or a business advertising on the 'net. Pete says it clearly--he thinks I'm attempting to restrain amsoft from doing trade!! Would he think or say something like that if he *WASN'T* doing trade???! You decide. I guess all further criticism of these guys best be done thru the offshore anon servers.... Imagine a thousand corporations just like this one, puking terabytes of commercial ads into the net. It'd be tough just to find the real traffic through the junk mail.

[recieved from amsoft@epix.net]

>Hi;
> One of your users (AMSOFT) is posting offers for a "FREE HAM NEWSLETTER"
>on the rec.radio.amateur.* usenet groups that, in my opinion, constitute
>thinly veiled attempts to electronically market their CD-ROM product. I ask
>you to look into this and decide for yourselves if you wish to see several
>thousand businesses conducting themselves this way over the net in a year or
>two. I believe that if we [specifically you] allow this sort of
>comercialization of the internet, we will see many of the providers net-wide
>pull their resources away from the net community. Please put a stop to it.
>Thank you
>

The above paragraph borders on liabel based on your attempt to restrain AmSoft from doing trade. Unless you clearly know the LAW in this situation, I urge you contact you attorney. You should cease your conduct IMMEDIATLY!

(plus contents of a previous letter from bob@texas.net)

>I, for one, do not wish to see the internet become a medium which
>presents a non-hostile environment for those who wish to use it to
>spew forth electronic junk mail. Many other would-be advertisers
>have had their mailers crashed by angry replies to such electronic
>fecal matter. I wish the same on the hoseheads at AMSOFT.

BOB, your suggestion that persons should be asked to CRASH our MAILER
WITH ELECTRONIC FECAL MATTER will be met with a strong challenge here!

I would like to introduce you to my friend, K3RF. Robert Famiglio, Esq.
With the firm of Famiglio & Massinger, in Media, PA. Robert used to be
counsel to the ARRL and has 27 years of law practice. He has been our
company attorney for the last 3 years. And has represented AmSoft on both
copyright and cival litigation. I would hope that you have good sense and
can conduct yourself as a gentleman on the Internet. I hope this does not
require any further intervention.

I suggest you heed the warning I have given you and cease any further
harassment of employees of AmSoft and amsoft@epix.net.

I believe that I have made this point in the past, but...

I'm not sure that actual Alaskans ever discuss dividing their state. But
Texans do not, even as a joke. Dem's fight'n words, pard'ner...

In any event, I also maintain that the apparent size of Alaska is due to a
consipriacy of map-makers and their projections.

Is this using hydrogen gas? How does helium compare in lift?

Bob, I agree absolutely on this issue. In addition to e-mailing the inappropriate advertiser, send e-mail to his postmaster. Sometimes it's merely a post by someone new to the net, and a polite message to his postmaster will reinforce the idea that this really is a no-no. Even if this isn't the case and the poster is an unrecalcitrant slime bag, it's only fair to warn the postmaster about what may be heading his systems way. Some postmasters really do welcome knowing what their users are up to.

: SSTV operations, both high duty cycle modes. Limited FM operations
: should be possible on P3D without significantly impacting the
: power budget.

I believe such operations are only considered acceptable at low
ERP uplinks. On the other hand, getting a good downlink
on simple mobile whip requires a rather large amount of power
from the satellite. (3 dB polarization loss + 6 dB compared
to a simple CP yagi or helix).

People have complained a lot about how difficult it is to use
Oscar 13--signals aren't anywhere near as loud as they expect
them to be--they have to buy amplifiers and expensive antennas
to get OK but not great signals. I see the enhanced capabilities
as being enough to reward people for their investment--with the
new bird they ought to get pretty good results on SSB using exciter
power and small CP beam antennas.

True, if you wanted to use big antennas and/or amplifiers when the
satellite was lightly loaded FM would work (provided that you
reprogrammed the satellite so it wouldn't notch out the power
abusers). But, this isn't what most people are looking for
when they ask or think about "FM birds." The basic problem is
one of physics--when you are 100 times farther away you need
40 dB more gain/power. Light bulbs are much brighter when you
are within a foot as opposed to 100 ft away.

IF there is enough interest I could go into the actual numbers, but
this post is long enough...

I'm very curious where you discovered the information that indicates
it "... contrary to Internet's policy ...". As far as I know, there
IS no such entity as "Internet" to have a policy. Could you be a bit
more specific where you located this policy information? Any sort of
reference will do: ftp, email, http, whatever. I'd like to review
the policy you are talking about before making any further comments.

Howdy:

I am currently trying to put together an amateur station to
experiment in the S band. I looked at AMSAT's www for info
on tracking software. I would like a software package that
will control my antenna. It seems InstantTrack (PC) or
Microsat Groundstation (Linux) would be best.

Can anyone tell me how these packages interface to my
pedistal motors? Also, any opinions on these options
would really be appreciated.

>Dave Mullenix, N9LTD

In my humble opinion, I think the AmSoft posting was appropriate.
It told me a new version of the product was available and where
to get more information. It was brief, didn't mention prices, and
was posted ONLY to appropriate (ham radio) groups. This is useful
information.

A few facts:

1. Years ago the Internet backbone was government funded and was only
supposed to be used for non-commercial purposes. That changed about
3 or 4 years ago. It is now commercial with no restrictions on
commercial use. I was the Internet contact for our site at the time
so I got all the official info and saw the significant jump in the
monthly bill.

2. Netiquite (sp?) is not law or a contract between network service
providers and users. It is only generally accepted guidelines
of the culture of the newsgroups. There are many newsgroups dedicated
to particular commercial products used for communication between
manufacturers and customers.

3. There are only a few big companies in the ham radio market. The
transceiver manufacturers, AEA, MFJ, and very few others are big
companies that can afford full page ads. Most of the others are
just one person at-home "basement" operations persued nights and
weekends in addition to regular full time jobs. Don't be fooled
by the fancy names like "XYZ Technologies" or "XYZ Research".
I know several people personally who fit into this category. Most
people feel more comfortable dealing with a big company instead
of a basement operation so it really is necessary to give the

the impression of being bigger.
We should thank and encourage these people for bringing us interesting products that larger companies wouldn't want to be bothered with due to tiny market and low margins.

If some one is truly abusive of the communication channel we should scold him and even ask the site administrator to revoke access. However this was not terrible abuse.

73,
John WB2OSZ

Any of a number of books at your local library or bookstore can fill you in on the history and evolution of what we now call the "Internet". It's original purpose was to connect Universities and other educational institutions for educational purposes. Major advances in this regard were made by the National Science Foundation. Commercial participation was once excluded or severely restricted. The intended purpose of the "creators" was educational advancement (much of it at taxpayers expense), not providing commercial enterprises with new ways to make money. Commercial connections are now common, the limitations on use much more flexible. There are no laws that I know of which prohibit advertising on the net, however the vast majority of commercial enterprises connected to the net honor the traditional "ban" on overt advertising and limit their use to their own research and development purposes and for business communications. They understand and respect the original purpose and intent of what has become the "Internet", and respect the wishes of the majority of users, as well as the wishes of those who have made "Internet" possible.

Virtually every major business from IBM to Intel to General Motors has Internet access. When was the last time you saw a commercial here from one of them?

Again, there are dozens of books that discuss Internet history and purpose. I've not done it, but I imagine you could also come up with lots of similar info if you do a Gopher search on some key relevant topics.

Feel free to let me know what you discover in your research.

192. Two-Line Orbital Element Sets (TLE541)

Newsgroup: rec.radio.amateur.space
Date: 1995-01-31 06:35:14 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.791534114@eel>
Source record: 25891

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

193. Alden WEFAX Move?

Newsgroup: rec.radio.amateur.space
Date: 1995-01-31 07:11:47 UTC
From: rbates@nermal.santarosa.edu
Message-ID: <3gknrj$6vu@floyd.santarosa.edu>
Source record: 25892

This is similar to a post on another group. I understand that the WEFAX data that is on S3/17 is in the process of being moved to G4 Ku.

Does someone know what transponder (and subcarrier frequency) is used at the new location?

I also understand that there may be some encryption (boo). Anyone help out there too?

This has been used for personal use only by several of us. We will hate to lose that feed since it is convenient. Sounds like I will be getting an S band setup soon (1691 for GOES direct).

Thanks in advance.

Rick WA6NHC

So, it would be okay for me to use epix.net to distribute
pornographic material. Or use it for net drug trade. Perhaps
post mass quantities of skin-head propaganda.

Nah, didn't think so. Epix.net is only uncensored to those views
you happen to agree with.

195. HRPT NOAA14 hot edges

Newsgroup: rec.radio.amateur.space
Date: 1995-01-31 14:13:36 UTC
From: roffer@rcf.rsmas.miami.edu
Message-ID: <3glgig$s3@umigw.miami.edu>
Source record: 25894

We are receiving NOAA 14 images and it seems that the edges
of the images are too warm. We had the same problem with
NOAA 11, but not with NOAA 9 imagery. Is anyone else having
these observations? More details: the last (or first) several
pixels appear warmer on the edge of the image. This makes
compositing images over a few day period not usable as the
warm edges contaminate the composite.

thanks

Mitch Roffer
roffer@rcf.rsmas.miami.edu

Are these HRPT pictures? I have a question about HRPT. My "Satellite
Experimenter's Handbook" notes HRPT frequencies at 1707.0 MHz (NOAA-11),
1698.0 MHz (NOAA-10), and 1707.0 MHz (NOAA-9), but it doesn't say
any thing else really. Is HRPT FM also? Is a 30-50 kHz IF strip
enough or do I need more bandwith?

Thanks in advance,
Mark

The system that KE4ZV proposed looks very interesting and I know that I
for one would be interested in participating. My question is: Who would act
as the central gathering point for the data obtained? Keeping up with it
the volume of data produced would be no small job.
It's probably too early in the game to raise this point but I definitely
would like to see something like this get going.

>
> ... Hank
>
I agree that people shouldn't throw the "policy" terminology around,
especially because the attarction of the NET is that there are really no
hard and fast rules....things happen or do not happen as a result of
"gentlemens' agreements"

Use of the NET for commercial purposes is tempting, but my opinion is
that the best thing to do is for "advertisers" to voluntarily restriuct
their postings to areas set up for it. Otherwise, can you imagine what
some "enterprising" commercial entities would do to these USENET groups?

I use the word "enterprising" in quotes...these people are the same ones
who believe that they are "clever" when they park in a handicapped
parking space and get away with it, and that the rest of us "saps" were
not thinking or not willing to take a risk. We could legislate against
boorish behavior on the NET, but lets hope it never goes that far.

And in case you are wondering, Hank, I'm not some fresh-faced college
kid cooped up in my dorm room pecking away at my computer
at 2:30am philosophizing about how the world SHOULD be (not that there
is anything wrong with that). I'm a professional marketer with a real
soft spot for advertisng and business.

201. AO-27? Hello? (again)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-01 01:34:31 UTC
From: greg@core.rose.hp.com
Message-ID: <D3AsDK.Kt3@icon.rose.hp.com>
Source record: 25899

Sorry for the duplication, but my previous post on this expired locally before I could look for replies...

Has anyone heard AO-27 lately? My last contact with it was months ago. Assuming it's still alive, what, if any, is its operating schedule? Have the frequencies changed (145.850 up, 436.800 down)?

Thanks,

Greg KD6KGW

Congratulations....This is the first LOGICAL and UNEMOTIONAL
response, I've seen to this issue. Actually, if more people
would have taken your attitude, and not started exploding
flame mail (do I get flamed for saying this?) it would have been
over quickly. As it is, AMSOFT has gotten TONS of free
advertising, and more word-of-mouth exposure than they ever
expected.

I kind of liked the touch on the part of one AMSOFT rep
who just recently put the WHOLE AD on each of his replies
as his signature file -- nice touch!

As a HAM who let his ticket expire 20 years ago (when I
got married and then joined the USMC), and is just this next
Tuesday re-taking the exam, I have just one question...

Do you guys behave this way on the air? My experience
has always been that of the courteous HAM. Helping the
Novice and "gently" correcting anothers mistake or
indescretion used to be the rule.

I, for one, would try expressing my opinion directly to
the miscreant, rather than e-mails to admins (which
obviously did nothing). I think the folks at AMSOFT might
have responded more favorably to a reasonably-voiced
complaint than to naked aggression. Also, be aware that

AMSOFT needs the HAMS to purchase their goods, so
I don't believe they'ed intentionally want to annoy us to
point of not buying their product(s).

Why does world.std.com sound so familiar? Wasn't someone at that
site also posting ads on the rec.radio groups? This might explain
your `humble opinion':

>In my humble opinion, I think the AmSoft posting was appropriate.
>It told me a new version of the product was available and where
>to get more information. It was brief, didn't mention prices, and
>was posted ONLY to appropriate (ham radio) groups. This is useful
>information.

It was posted to *all* the radio groups many times. If only one post
to .swap had been made no one probably would have minded.

>A few facts:
>
>1. Years ago the Internet backbone was government funded and was only
> supposed to be used for non-commercial purposes. That changed about
> 3 or 4 years ago. It is now commercial with no restrictions on
> commercial use. I was the Internet contact for our site at the time
> so I got all the official info and saw the significant jump in the
> monthly bill.

A very large portion of is is still government funded: State taxpayers
foot the bill for the .edu sites (millions of dollars per year here
to run 5 unix mainframes for 45,000 students/faculty and to pay the
long DX telephone bills to all points in the Pacific). Keep in mind
that a good portion of the traffic that has originated at non-.edu
sites gets passed through those sites. If the state government-funded
.edu sites each pulled their plug Internet would probably cease to exist.
Thus, your `fact' isn't quite factual.

This is the more current thinking, probably closest to fact.

>
>
>Any of a number of books at your local library or bookstore can fill
>you in on the history and evolution of what we now call the
>"Internet". It's original purpose was to connect Universities and
>other educational institutions for educational purposes.

I must disagree herre, don't always believe what you read!! Just because it
is in print does NOT mean that it is in the least bit accurate. In the early
70's the "Internet" as you call it was born out of DARPA, Usenet, and several
other "local" networks. It's original purpose, no matter what is claimed
after the fact, was NOT to connect Universities. It's main purpose was to
allow exchange of information between large gov't agencies and their sub-
contractors, typically universities and such. Don't confuse the facts.

>Major
>advances in this regard were made by the National Science Foundation.
>Commercial participation was once excluded or severely restricted.

I agree with the first inthat the NSF funded research and development along
with others. However commercial participation has always been an important
part of the net...just ask BBN, DEC, etc about this. Ithink the difference
here is that it was better self-controlled... (opinion mine)

>The intended purpose of the "creators" was educational advancement
>(much of it at taxpayers expense), not providing commercial
>enterprises with new ways to make money.

BZZZZTTT! Wrong again read above...it was a gov't funded program...

>Commercial connections are
>now common, the limitations on use much more flexible. There are no
>laws that I know of which prohibit advertising on the net, however the

>vast majority of commercial enterprises connected to the net honor the
>traditional "ban" on overt advertising and limit their use to their
>own research and development purposes and for business communications.

See the above on peer pressure, self control, etc..

>They understand and respect the original purpose and intent of what
>has become the "Internet", and respect the wishes of the majority of
>users, as well as the wishes of those who have made "Internet"
>possible.

Again youmiss the point, read some of teh comp.sys groups and see how well
the big vendors "respect the wishes of the majority". Those companies use
the net as their own....whether you agree or not, that is the fact...

Internet is/was made possible by large donations of money, time and hardware
from big business and the government. Not by some collective of users or
universities. If we waited for academia to decide how to do things we would
still be waiting for an 8bit computer... Keep this inmind as things move
on and we "bite the hand that feeds us" turning the net over to the MCI's,
sprint's etc of the world.

>
>Virtually every major business from IBM to Intel to General Motors has
>Internet access. When was the last time you saw a commercial here
>from one of them?

Read the correct groups and you will see in some way shape or form either
blatant or subtle adverts from them all. They are not going to miss out
on a chance to target their market. How better to beat demographics?? If it
isn't happening in "your" group, IT WILL!

The key is not "power" as in watts out of the transmitter, but "power" as in EIRP (effective isotropic radiated power) as in directed power out of the antenna. With a good uplink beam, like the 40 el KLM circularly polarized crossed Yagi setup (15+ dB gain), 25 watts will easily get you into the bird under good conditions (squint/off point angle <15 deg. or so). For less optimal conditions, you may want up to 100 watts, even with the 40 element beam. I suggest that you get the "Beginners Guide to Oscar-13" from AMSAT (850 Sligo Ave., Suite 600, Silver Spring, MD 20910). It will answer this question, and many others in far more detail.

GREGORY>>...it is contrary to Internet's policy for Internet to be used as a vehicle for commercial advertisement...

True or not, commercialism abounds in the Internet. And it cannot be stopped.

I found AMSOFT's ad - or press release - enlightening and appropriate for this Conference.

I would be disgruntled and offended, however, if I were to be subjected to Press Releases touting X-Rated magazines, marital aids, or any other topic NOT related to the current Conference.

This country's business news is mostly Press Releases. We need this information. We can save or delete what we want - and we do not want to be censored in any manner, shape, or form (another Internet goal).

212. Shuttle-Mir flyby schedule

Newsgroup: rec.radio.amateur.space
Date: 1995-02-01 21:15:28 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3gotlg$6gc@news.doit.wisc.edu>
Source record: 25908

Here's a description of the Shuttle-Mir rendezvous and fly around. It's
from the STS-63 press kit, STS63KIT.ZIP. This is available from
NASA Spacelink. FTP or HTTP to: spacelink.msfc.nasa.gov

Note that all the fun takes place Sunday afternoon Eastern Time.
Should be some great live TV! I guess this means that Sunday
morning would be the best time to look for the two spacecraft flying
in formation.

Ti-Burn, Mir 3/10:55 11:55 AM, Feb. 5 EST
V-Bar Arrival, Mir 3/12:35 1:26 PM, Feb. 5 EST

SHUTTLE MIR RENDEZVOUS AND FLY AROUND

STS-63's primary objective is to rendezvous with the
Russian Space Station Mir in a dress rehearsal of
cooperative missions that will follow later in 1995. The
approach will serve to test the systems and techniques
currently planned for the first Shuttle docking mission,
STS-71, currently scheduled for June 1995.

The rendezvous sequence will begin about nine hours
into the mission when a reaction control system jet firing
adjusts the rate at which Discovery is closing on Mir. Over
the next few days, additional burns will gradually bring
Discovery to within eight nautical miles behind Mir. At
this point, the Ti burn is fired and the final phase of the
rendezvous begins. Discovery will close the final 8
nautical miles to Mir during the next one-and-a-half-hour
orbit. At this point, the Shuttle's rendezvous radar system
begins providing range and closing rate information to the
crew.

The manual phase of the operation begins just after
Discovery passes about a half-mile below Mir when Commander
Jim Wetherbee takes the controls at a distance of about
2,000 feet. Wetherbee will be flying the Shuttle from the
aft flight deck controls as Discovery circles up to
intersect the velocity vector of Mir. The velocity vector,
also known as the V-Bar, is an imaginary line drawn along
Mir's direction of travel.

Wetherbee will stop Discovery's approach when the
Shuttle reaches a point about 400 feet directly in front of
Mir.

After the Shuttle moves to within 1,000 feet of Mir, Discovery's steering jets will be fired in a mode called "Low Z". This approach uses braking jets that are slightly offset to the Mir rather than steering jets pointed directly at the Station, thus avoiding contaminating or damaging the Station. Also, as Discovery reaches close proximity to Mir, the Trajectory Control Sensor, a laser ranging device mounted in the payload bay, will supplement the navigation information by supplying data on the Shuttle's range and closing rate to Mir.

Discovery will maintain its position 400 feet in front of Mir until Flight Control teams in Russia give a "go" for the Shuttle's approach. Wetherbee will then slowly fly the Orbiter from 400 feet to a point about 30 feet from Mir, aligning with the Station's docking module in a rehearsal of a docking approach planned for Shuttle mission STS-71. To assist with the alignment, Wetherbee will watch the approach from a centerline television camera, mounted in the upper window of the Spacehab module, on a monitor in the aft flight deck. When within about 200 feet of Mir, Discovery will begin air-to-air communications with cosmonauts on Mir using a VHF radio system.

At 30 feet from the docking port, Wetherbee will again stationkeep, rehearsing a maneuver to orient Discovery properly to the docking port, before slowly backing the Orbiter away from Mir.

When Discovery is again about 400 feet from Mir, Wetherbee will begin a slow fly-around, maintaining a distance of about 450 feet from Mir. Discovery will completely circle Mir once over the next 45 minutes.

The two spacecraft will begin the separation sequence when Discovery reaches a point about 450 feet above Mir for the second time. The Orbiter will then fire its steering jets in a maneuver that will put it on a course to eventually take it ahead of Mir as Discovery opens the distance between the two spacecraft with each orbit. Throughout the operation, Discovery's crew will use video and still cameras to document the exterior of the Mir.

The rendezvous will validate a number of flight techniques that will be employed on subsequent docking missions. These techniques include the use of precision flying as the Shuttle closes in on Mir, validating the use of a centerline camera for targeting the docking mechanism on Mir, verifying the absence of plume effects, demonstrating VHF radio communications, inspecting the Mir complex through photographs and video, and demonstrating the joint operations between Mission Control Centers in Houston, and Kaliningrad, Russia.

While the fly-around will provide valuable information for flight designers planning the docking missions, the completion of these objectives is not mandatory in preparation for the STS-71 mission.

I think the recommended EIRP is 500 watts. So you need a power gain of 20
or roughly a 13 dBi antenna. Most of the circularly polarized (CP)
cross yagis on the market should give you that much gain on 70 cm. Make sure
your polarization is correct if you have CP antennas. Also, conditions
may not be very good at the moment or the off pointing (squint) angle
may have been high. Can you describe your station in a little more
detail and also provide an example of when you tried to use AO-13?

I think it won't.

Most "major businesses" like IBM and General Motors have a Public
Relations department for such "market targeting." There are usually
specific personnel policies to discourage individual employees from
engaging in "public advertisement" of the company. Ever see a .sig
with a disclaimer about not speaking for one's employer? :-)

"Corporate entities" are usually pretty paranoid about offending
people, and advertising in newsgroups tends to offend many people.

Source record: 25925

Hello Gary
I'm glad some one is thinking about this it has bugged
me since 1971
after doing some VLBI Woomera -Tidbinbilla and
Goldstone - Tidbinbilla, I was convinced that it was feasible
but mobilising the army of hams, swls and amateur astronomers
defeated me. Professional Astronomers and Cosmologists
would need to be involved. The network of people to co-ordinate
and pass the data would be huge. Many talents would be
required to accomplish this task, great patience would be
required as individual observers would be unable to make much
out of their own data. True altruistic co-operation would be
required, lack of that is probably the down fall of this dream.
It is very true what you say about the HF Data being a new frontier.
There are probably different ways to achieve this project
a synchronous clock and a digital sampling Technique would figure
high on my priority list as data in this form would suffer no further
degradation, once digitised. A further advantage would be that it
would be transmittable unlike some analogue methods.
The processing and correlations functions would be easier as the
data would already be in a useable form. the rapid proliferation of
Digital computers,digital recording techniques make it a starter.
home computers where not a starter until the VDU was
implemented to replace the old type 33/33A TTY machines that
we where forced to use prior to that. The Cassette recorder was
widely distributed and pressed into service to get mass computing
of the drawing board, but it didn't last long once economic digital
methods came along with the Calcomp discs and the extensions
of that principle. Packet could carry some real but non commercial
traffic at last to transfer the observational data for processing.
A development group needs to be set up to spec a receiver and
antenna system that will do the job and is practical for amateur
use. Et. Etc. Wibble wibble. What do you think of that Maxwell guy
he started something when he played with Faraday's work, him an
encyclopedia salesman too.

35th Lafayette Hamfest
March 10-11-12, 1995
Holidome - Holiday Inn Central
Lafayette, Louisiana

The 35th Annual Acadiana Amateur Radio Association (AARA) Lafayette Hamfest
will be held at the Holidome just south of the intersection of I-10 & I-49.

There will be commercial dealers, a flea market, technical forums, tours for
those interested in the area's attractions, the famous AARA fox hunt, and
plenty of Cajun hospitality.

The Quarter Century Wireless Association (QCWA) Cajun Chapter #189 will host
a dutch treat breakfast buffet at 8:00 a.m. on Sunday, March 12th.

FOR MORE INFORMATION:

If you'd like to find out how you can reserve swap tables, or pre-register,
or attend the V.E. test session, or anything else..... Please contact:

And the answers are the same, as well.

>I also understand that there may be some encryption (boo).

As you heard there, it is digitized and available only if you pay for the service. Hacking a descrambler would be quite illegal, of course.

>Sounds like I will be getting an S
>band setup soon (1691 for GOES direct).

How true! Such a system (properly designed) would be capable of receiving far more information than the Alden, which is a selective retransmission. It would also not be subject to scrambling. I beleive a feedhorn could be mounted to your C band dish next to your existing feed. Or is this a repeat as well?

That depends. What antenna have you, what is the cable to it and how
much of a cable run, and what orientation and antenna mode is the
satellite in. A couple of years ago I was uplinking 10 watts on
C.W. and occasionaly SSB to an AOP-1, but the cable (RG-8) was
about 3 m long, and most contacts came when the satellite was close
to the Earth.

What's your ERP? I've never needed more than 40 watts to put a signal
on the bird equal in strength to the beacon (that's as loud as you should
ever be). Under most conditions, considerably less power does fine. Of
course the secret is in the antennas and feedlines. If you are using a
KLM-40CX antenna for uplink, and need more than 10 watts to the antenna
under any conditions to be heard, then you've got something seriously
wrong with your station. 5 watts will generally put a usable signal
on the bird. Of course to *hear* yourself, you need a decent 2 meter
receiving setup too. A KLM-22C with a good GASFET preamp mounted at
the antenna is required if you want to hear weaker signals.

A good test of your receiving setup is to see if you can hear the
spin modulation on the transponder noise floor. If you can hear that,
your receiving setup is good enough.

>Is this using hydrogen gas? How does helium compare in lift?

Yes, it is. Helium will have less lift, so you'll either have to inflate the balloon to a larger size to get your payload off the ground, which means the balloon will expand to bursting size at a lower altitude, or you'll have to cut the payload weight so the same volume of gas will lift it off the ground and expansion to burst size will occur at the same altitude as with hydrogen.

Unfortunately, I don't have any numbers to plug in here. Anybody got the formulas for this sort of work?

228. FTP addresses for Orbital Elements

Newsgroup: rec.radio.amateur.space
Date: 1995-02-02 21:38:40 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3grjd0$ka3@news.doit.wisc.edu>
Source record: 25927

Internet FTP sites for Orbital Elements

archive.afit.af.mil /pub/space

Home of the TLE.nnn files posted by T.S. Kelso, the father of amateur satellite tracking. Includes individual files sorted by type of satellite and a larger list made of all the little lists added together.

kestrel.umd.edu /pub/wxsat/elements

Also WxSat & Radar GIFs, software

kilroy.jpl.nasa.gov /pub/space/elements/molczan /pub/space/elements/satelem

This site has the Mother Of All Element Files in the /pub/space/elements/satelem directory. Prepared by Alan Thompson, it's 1/4 meg in the .Z compressed format and expands to about 1/2 meg when uncompressed. It holds elements for just under 4000 satellites! No sat names are given, just the NORAD numbers, so you'll need a cross reference.

Ted Molczan's Canadian Space Society's element files are in the /pub/space/elements/molczan directory. This is a more reasonable length file that includes elements for spy sats.

seds.lpl.arizona.edu /pub/sat/molczan C.S.S. tles w/spy sats /pub/sat/satelem T.S. Kelso elements

This site appears to be mirroring kilroy's element directories. If the .Z is left off the file names, seds will uncompress the file for you before sending it. This doubles transmission time, but if you can't decode .Z'd files, this will get the files for you anyway.

DOS users: ftp gzip.exe from /pub/space/elements at kilroy to uncompress these files at home. Mac users: if you have a program that handles .Z'd files, please let me know.

Everybody: if you have any other FTP addresses for elements, please let me know.

>out of DARPA, Usenet, and several other "local" networks. It's original
>purpose, no matter what is claimed after the fact, was NOT to connect
>Universities. It's main purpose was to allow exchange of information
>between large gov't agencies and their sub-contractors, typically
>universities and such. Don't confuse the facts.

One amplification of something alluded to above: these messages are
part of USENET, which is NOT the INTERNET. It's always been my
understanding that different policies apply to the small part of the
internet that is usenet. I have no problem with IBM or any other
commercial organization sending email or files via the internet or
setting up FTP sites or Webservers or engaging in any other kind of
commercial activity on the internet. Having my tax money pay for
those activities is like having trucks on the Interstate - I can live
with it as long as they stay out of my way.

I _DO_ object to commercial messages on USENET. I don't enjoy having
my tax money used to pay for somebody to send me advertisements that
are mixed in with the legitimate messages in such a way that it's
extremely difficult to avoid them. That puts me in the position of
paying to be annoyed. If it gets bad enough, I'll say to heck with
it and stop reading the messages. Needless to say, if my congressman
then announces that dropping government subsidies to the usenet would
help balance the budget, I won't object very strongly.

After all, why pay good money so somebody can annoy you for their profit?

Perhaps we need rec.radio.commercials?

What I discovered is that there is no longer any restriction on
the use of the net for commercial purposes.

I've been "on the net" since well before ARPA funded the initial
connectivity between commercial (not educational) users. Some of
those users WORKED at universities, but the projects which used
the ARPA backbone and the various ad hoc interconnections that
existed prior to the backbone didn't do it just for fun.

Perhaps you need to look at those books (and papers and other documents)
before you make assertions about history.

... Hank

Some time ago I posted a message about the Amiga Amateur Radio User Group.

Unfortunately shortly afterwards and for reasons outside my control my
E-mail address got cut off! I know several Amiga using amateurs tried to
reply but got bounced E-Mail.

In brief the AARUG is UK based but welcomes members from anywhere in the
world. There are already several hundred members. The AARUG publishes an
occasional newsletter and maintains a radio PD library. Membership is free;
the group runs entirely on voluntary donations.

There's an introductory floppy disk available containing details of how to
join, member lists, old newsletters and the PD list. For more information I
can now be contacted at my Internet address: paul.whatton@posnet.co.uk or
via FidoNet at 2:254/214

Hi,

I have used the *following* data during the last week and I had no problem
with the tracking:

SB KEPS @ AMSAT $ORBS-027.N
2Line Orbital Elements 027.AMSAT

HR AMSAT ORBITAL ELEMENTS FOR AMATEUR SATELLITES IN NASA FORMAT
>From WA5QGD FORT WORTH,TX January 27, 1995
BID: $ORBS-027.N

[.. deleted ..]

RS-15
1 23439U 94085A 95025.17305041 -.00000039 00000-0 10000-3 0 234
2 23439 64.8154 126.2803 0167711 286.6267 71.6313 11.27524471 3393

[.. rest deleted ..]

Today, or may be tomorrow, there are new data available; hopefully, hi.
But, I am sure, the difference may be only few seconds!

BTW: I have made the experience, that the RS-15 has a very weak signal.
The RS-10/11 makes a 2..4 S-stops stronger signal. What is your
impression?

Have fun ..

No joke. If it's omni-whip mobile reception that's wanted, well
that's right out. No way P3D is going to be able to do that.
The situation I was considering is the fellow with no multimode
transceiver, but with a decent set of satellite antennas. He
should be able to use his ordinary FM equipment at low to moderate
power through P3D without causing any harm other than occupying
excess bandwidth. Since the transponders of the existing birds
are rarely wall to wall signals, one might think that such operation
wouldn't be damaging to the usefulness of P3D. With FM threshold
improvement, a CNR of 12 db (about typical for a SSB signal on
the birds) should give him a SNR approaching 20 db quieting.
That's pretty useable without hurting the transponder power
budget. SSB is typically 20% or so duty cycle, so the FM signal
would be about 5x as power consumptive, but P3D will have 10x
the power budget, so no harm no foul.

>People have complained a lot about how difficult it is to use
>Oscar 13--signals aren't anywhere near as loud as they expect

That's certainly true. All I was suggesting was that with Oscar 10-13
class receiving antennas, FM operation on P3D should be feasible.

>True, if you wanted to use big antennas and/or amplifiers when the

>one of physics--when you are 100 times farther away you need
>40 dB more gain/power. Light bulbs are much brighter when you
>are within a foot as opposed to 100 ft away.

Well, like I said, I think that the FM improvement ratio, provided
a sufficient modulation index is used, should allow reasonable
signals to be copied with Oscar 10-13 class antennas without
drawing the attention of the auto-notch on the bird. I'm not
recomending FM operations on P3D, just noting that they seem
feasible. You'd need a receiving setup that can hear the spin
modulation of the transponder noise floor, but that's not hard,
and is something all satellite operators should strive for anyway.

> required, lack of that is probably the down fall of this dream.

So true. The current packet "network" typlifies how difficult it is to get long term cooperative efforts going and sustained. Hams just aren't cooperative by nature. The culture has been one of competition too long, Dxing, contests, etc. There's no place for competition in this effort, so it's unlikely to gather the support needed to make it a reality.

> It is very true what you say about the HF Data being a new frontier.

Yes, I think that would be really exciting. At UHF and above, VLBI with existing radio telescopes is feasible, but HF is an area where only the intensely decentralized amateur effort could possibly succeed. It's simply not feasible for the professionals to support the number of dispersed dipoles needed to synthesize a narrow beam.

> There are probably different ways to achieve this project
> a synchronous clock and a digital sampling Technique would figure
> high on my priority list as data in this form would suffer no further
> degradation, once digitised. A further advantage would be that it
> would be transmittable unlike some analogue methods.

Well, the key of course is to be able to preserve phase coherence from the antenna to the data. Flash A/D chips are getting cheap enough to do that at HF while still fitting into an amateur's budget. I now picture a TRF front end feeding a flash A/D which in turn feeds the data capture system. The A/D sample clock would be slaved to a high precision reference such as a signal from a TVRO setup, or perhaps WWVL. The data could be captured to very fast streaming tape.

The alternative of a block downconverter with a high precision LO reference feeding a modified VCR for analog data storage and later digitization is still a contender of course. I'm not sure which would be the better course. The direct capture to streaming tape method would be pushing the limits of data storage quite a bit, but the block converter to modified VCR to digitizer method would require 3 phase offset corrections. The timebase correction of the VCR would be the dominant one. That still takes some fairly expensive custom chips.

The direct converting receiver could probably be built for under $200, minus the precision reference. The other method likely would cost 5 times as much. I'm more comfortable with the technologies involved in the latter method, however, due to my broadcast background. And it does place less strain on the station's computing resources.

Gary

Do you have evidence to back up this assertion?

It is *illegal* to park in handicapped parking spaces, at least
in most jurisdictions. It is not *illegal* to post commercial
messages to usenet. You have here compared an *illegal* act to
an act *which you personally consider objectionable*.

If you wish a newsgroup without advertising, then you should take
those actions which will lead to such a newsgroup: a call for
moderation of the group, or a call for a new (moderated) group.
Within usenet, this is the only mechanism available to control
content - other than peer pressure ... and you will lose this one.

>of yourself, you did not need to respond.

It certainly IS up to the individual whether or not to receive a newsletter, or, for that matter, advertisements. It was your decision to inflict your advertising on this newsgroup that caused the response in the first place.

I don't have any problem with using the Internet to send your newsletter to someone who requests it. Advertise it on your WWW page or in print, etc. That's fine. It's another matter altogether when you post advertising in newsgroups where that is NOT acceptable behaviour, and where readers are NOT expecting to read advertisements.

Posting advertisements in newsgroups where they are not acceptable is the e-mail equivalent of junk faxes. Where the recipient pays for the cost of receiving the ad, whether or not he wants to read it.

The purpose of newsgroup charters is to organize discussion/information by category for the reader. It allows the reader to make intelligent decisions about which groups to read, based at least in part on whether or not he expects ads in that group. Circumvention of newsgroup charters and tradition by those seeking to advertise their wares is not only rude and impolite, but a disservice to all readers.

There are biz newsgroups available, you can use a Web page to advertise your newsletter, you can start your own mailing list, and no one will find this offensive. Expecting us to pay for unsolicited and unwanted intrusions into our newsgroups is another thing altogether.

>The ease of posting Usenet News articles causes many inappropriate
>articles to be sent to the network.
>An article can be inappropriate if it:
>
>-- Is devoid of useful information or ideas.
>-- Is sent to inappropriate newsgroup(s).

It's a pity you don't seem able to understand the above line.

>Last but not least BOB, your suggestion that persons should be asked to

>

Threats to complain to someone's commanding officer because he objects to your violation of netiquette by posting offensive advertising in newsgroups are highly inappropriate. I hope that your threat gets the widest possible circulation, and induces others, as it has me, to boycott any product you or your company is associated with.

You, sir, are despicable.

I disagree, John. Just because the product itself is amateur radio
related doesn't make advertising such a product itself in an amateur radio
newsgroup appropriate. It's the e-mail equivalent of junk mail with the
"bonus" that you pay to have it delivered to your system.

The Internet <> Usenet, John. I don't disagree with commercial traffic
flowing over the Internet in the least. I do, however, object strenuously
to businesses which post advertisements in Usenet newsgroups which by charter
or tradition have not carried those kinds of posts. Posting ads in groups
which the reader has selected at least in part because of the absence of
the ads is wrong.

>2. Netiquite (sp?) is not law or a contract between network service

That's true, John, but these guys weren't advertising in rec.radio.amsoft,
where the newsgroup charter might include those kinds of posts. If they
want to start a new group with ads, let 'em fly at it. I won't read it, of
course, but that's MY decision to make, not THEIRS.

> due to tiny market and low margins.
>

Of course we should. This doesn't mean that because they're small and/or struggling companies they should be encouraged to flout newsgroup conventions - which are conventions for good reason.

>If some one is truly abusive of the communication channel we should
>scold him and even ask the site administrator to revoke access. However
>this was not terrible abuse.
>

This example certainly wasn't as egregious as a lot I have seen. The problem is, John, that this is the thin edge of the wedge. I don't want to pay for receiving newsgroups where 50 % of the messages are from corporations trying to sell me something. Which is precisely the direction we're heading if we let them (the advertisers) in the door.

250. 138 MHz beam antenna

Newsgroup: rec.radio.amateur.space
Date: 1995-02-03 21:58:34 UTC
From: jpd@isoroku.mit.edu
Message-ID: <3gu8ua$ind@senator-bedfellow.MIT.EDU>
Source record: 25949
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.space,rec.radio.amateur.antenna

Does anyone out there know of a good 138 MHz beam antenna? I need
circular polarization and 12-14 dB gain.

The objective is to find a way to build low cost receive-only ground
stations for the HETE (High Energy Transient Experiment) spacecraft,
which will be launched later this year. Selected data will be
sent down at at 137.96 MHz (the main downlink is S-band).

For those interested, HETE will transmit linear polarization, but
Faraday rotation will cause the plane to revolve rapidly. With a
circularly polarized receiving antenna (either left or right handed),
this rotation becomes a frequency shift, which is small compared
to the doppler shift and therefore not a problem. A linearly
polarized antenna, in contrast, will see severe fading, disrupting
the modulation.

It's probably best if you reply to me by e-mail, given that I'm
cross-posting this to four busy groups.

Thanks in advance.

John Doty
HETE Project Scientist

jpd@space.mit.edu

251. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 00:31:40 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.791857900@tiger>
Source record: 25950

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

252. Two-Line Orbital Element Sets (TLE544)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 00:34:04 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.791858044@tiger>
Source record: 25951

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

253. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 00:36:05 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.791858165@tiger>
Source record: 25952

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

255. Re: Is SAREX onboard Discovery?

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 00:54:57 UTC
From: tomsunman@aol.com
Message-ID: <3guj91$oeq@newsbf02.news.aol.com>
Source record: 25954

<Is the Space shuttle Discovery carrying amateur radio this mission? Can
<someone please post the discoveries KEP's?

John,
Yes discovery is carring Sarex, config. M - Voice only.
keps are in this newsgroup or sci.space.shuttle.

Tom Randall

256. Yet Another Satellite Tracker (for WinNT)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 02:02:22 UTC
From: sia@bga.com
Message-ID: <3gun7e$qgs@lia.bga.com>
Source record: 25955

Binaries and sources for a native multi-threaded Windows-NT 3.5 based satellite tracking program (called VersaTrack) are available (for as long as they'd let me use the space), from ftp.realtime.com.

IT WON'T RUN UNDER WINDOWS 3.x (sorry!).

The orbit calculations are adapted directly from Manfred Bester's fine Unix sattrack program (versions 1 and 2 but not 3).

The package is fully functional, unrestricted, distributable, FREE and AS IS (without support, warranty, and with all standard disclaimers) for educational, hobby & non-profit/non-commercial use. However, it is a derived work and has multiple copyrights.

Some features:

- Real-time (or near-real-time) graphical (and numerical) display of positions for multiple satellites from multiple sites. Number of sat/site pairs restricted only by available memory and CPU juice.

- Notification of AOS via audiable alarms (chirps), and/or visual clues (poping icons).

- Tabular report and graphical display of ground tracks.

- displayed or reported times can be independently chosen for each satellite-site pair to be given in UTC, "local time", or "site local time".

- "Next" rise/set times display for any chosen satellite/site pair.

- Two user selectable maps (US and world). Current supported display resolutions are 640x480 (not recommended), and 800x600.

- All data files are regular ASCII text files.

- Integrated (and documented) support for utilization of external modules (i.e., other executables) for remote control of devices such as rotators and radios.

FPU/FPP or i486 or pentium (w/good FPU) and lots of memory are very strongly suggested!

ftp to ftp.realtime.com, login as anonymous. Then cd to pub/misc. The files are VERSATRK.ZIP (executales and related files), VSTSRC.ZIP (sources), RADSERV.ZIP (sample code), and readme.first. Verify the files against the following:

In article <3gtvp4$r2i@hpbab.wv>, hanko@wv.mentorg.com (Hank Oredson) says:

>If you wish a newsgroup without advertising, then you should take
>those actions which will lead to such a newsgroup: a call for
>moderation of the group, or a call for a new (moderated) group.
>Within usenet, this is the only mechanism available to control
>content - other than peer pressure ... and you will lose this one.

No, there's also Cancelmoose[tm] and the advent of other cancelbot style-solutions to the spammers on the net. I agree that peer pressure is not likely to work--as long as a company has the potential to make so much as one sale, he's going to post ads to the net if he has no respect for the desires of the group's readers. I saw a post that suggested creating a group like rec.radio.amateur.ads to have a place where those who desire to read ads can go. But the advertisers wish to invite themselves into our living rooms and shacks, rather than place their ads on our doorstep.

Again, I refer those who feel imposed upon by spam ads to check out alt.current-events.net-abuse for some very enlightening reading, starting with the FAQs there.

259. How much power do I need for AO13?

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 04:43:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A2D517.14E6000088.uuout@freddy.supernet.ab.ca>
Source record: 25958

Hi James,
In regards to your question...
-> How much power do I need to work AO13 mode B? AT present I have 25
-> watts and I can not hear myself.

With 25 watts you should be able to hear your downlink fairly well when the bird is in close range. Using this power level I would guest-a-mate that you can hear and work to approx. 25000 km without too much difficulty. The big trick is to get you 25 watts to the uplink antenna without too much loss.

My system: coax = 60 ft belden 9913 with N connectors to a MBM-48 (about 14 dbd gain less line loss approx. 2 db on 435 mhz)
= 60 ft belden 9913 with N connectors to 2 X 20 element cross yagis (about 15 dbd gain less 2 db line loss on 145 mhz)

I hope you can see that line loss is very important and your signals might be lost in your coax on both the up and down links. Also your antennas should have enough gain to make it happen.

Please have a good look at your system. Measure your power output at the antenna end of your coax. You may be surprised at what you find.

Hope this helps a little. Please let me know how you make out.

Isn't the synchrotron radiation (which dominates below 100 MHz) polarized ?

The Faraday rotation in the ionosphere would cause "interesting" effects
when received on a linear polarized dipole.

Aren't the flash A/D chips capable of operating in the upper HF range
only 6 or 8 bit ? Is this enough dynamic range, particulary if a wide
bandwidth is used.

> The alternative of a block downconverter with a high precision LO
> reference feeding a modified VCR for analog data storage and later
> digitization is still a contender of course. I'm not sure which
> would be the better course. The direct capture to streaming tape

How about a receiver consisting of two mixers with quadrature
LO feeds from a locked source. The I and Q output channels from the
mixers are directly connected to the L and R input of a DAT,
storing the amplitude and phase of a 20 kHz wide band.

The 20 kHz bandwidth should be enough as it should be much easier
to find a 20 kHz band free of man-made noise than a band several
megahertz wide. Also, the amount of computations at the correlation
stage would be greatly reduced.

An alternative to the DAT would be the old digital audio adapters
that once were used to store digital audio on VCRs. I do not know if
these adapters work with European VCRs in LP mode, but it sure would
be nice to record 10 hours of data on a 5 hour cassette.

As you know, Discovery is on its way for the rendezvous with Mir. If the sky in the San Francisco Bay Area is clear on early Monday morning, we'll have the perfect viewing opportunity to watch Mir and Discovery fly in formation.

IT CANNOT POSSIBLY GET ANY BETTER THAT THIS!

One can expect to see both spacecraft as bright as Jupiter, if not Venus. The Sun will be right at the nautical twilight limit and will illuminate both spacecraft on the side that we'll be looking at. Mir and Discovery will appear in the north-west (309 degrees) and will be passing exactly overhead. Mir will be leading, and Discovery will follow shortly behind. Below are the circumstances for this pass. Let's hope there is no fog or clouds on Monday morning at 6:35 PST!

Enjoy,
Manfred

266. RS-15 EUROPEAN SCHEDS.

Newsgroup: rec.radio.amateur.space
Date: 1995-02-04 22:17:26 UTC
From: kamer@ibm.net
Message-ID: <3h0udm$1ojq@news-s01.ny.us.ibm.net>
Source record: 25616

Hello, I am WB9ZAI, Harry Kamer, in EN-51 state of Illinois. I have recently started operating RS-15 satellite and still have yet to make any overseas contacts. I would like to set up a schedule with any interested amateur radio operators in England, Spain, France, etc. to make contact either CW or SSB.

Please leave a message and I will respond. Thanks and 73, WB9ZAI.

267. RS-12 Schedule contacts for WAS

Hello, I am WB9ZAI, Harry Kamer, in EN-51 (Illinois). I am trying to complete
WAS on RS-12 and still need Delaware, Hawaii, Alaska and Arkansas (!!).
If anyone is interested in scheds. or knows of any hams that are active from
these states on either RS-12 or RS-10, I would greatly appreciate a message.

Thanks for reading this message; 73 de WB9ZAI.

Sorry, got bad news about the shuttle.

It sounds like the shuttle will not be docking or even getting to close
to mir due to a two fuel leaks from the shuttle's thrusters.
Apparently the fuel leaking out would cause big problems for mir's solar
panels, so its best they don't get too close.

This news can from CNN this evening.

Information such as frequencies, type of transmission and other stuff.

275. HOAX against AmSoft

Newsgroup: rec.radio.amateur.space
Date: 1995-02-05 21:49:11 UTC
From: amsoft@epix.net
Message-ID: <3h3h4n$sev@grape.epix.net>
Source record: 25624
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.space

I question if the person called bob@texas.net really exists or if it was just a HOAX and a campaign by a spineless internet hacker to damage the AmSoft reputation.

I submit the following information and request that you as an individual test the information for yourself.

On 2/5/95 I did a FINGER on bob@texas.net and received the following information:

>--- Host: texas.net User: bob@texas.net ---
>Login name: bob
>In real life: Robert J. Scott
>Directory: /home/b/bob
>Shell: /bin/menu
>Last login Fri Jan 20 20:39 on ttyrc from sa-pm1.texas.net
>No unread mail
>No Plan.

Take a look at the LAST LOGIN DATE!
(Last login Fri Jan 20 20:39 on ttyrc from sa-pm1.texas.net)
So how is it that bob@texas.net has managed to post so many messages in the rec.radio.amateur.* usenets as bob@texas.net since Jan 20 and texas.net's finger has no record of it?

Take a look how he connected thru TEXAS.NET ON JAN. 20, 95
(on ttyrc from sa-pm1.texas.net)
Is sa-pm1 a code for SPAM?

It looks like the wool has been pulled over our eyes on this story.
Even the FCC records for WY7O don't correspond to the Texas area.
Whoever you are pretending to be WY70 we are onto your HOAX.

FYI, AmSoft has not posted any reference to it's products since January 27th and will not post reference to AmSoft products in the future except for the rec.radio.swap usenet, and in the amsoft signature when responding to usenet messages.

To all readers of the rec.radio.amateur.* usenets AmSoft posts this public apology to anyone that became annoyed by any aspect of the continuing posts by or about AmSoft and its product.

I request that nobody post a response to this article unless they intend for their message to appear in all 7 rec.radio.amateur.* usenets (read header of this message first)

Sincerely,
Pete, KC3TL

276. Re: HOAX against AmSoft

Boy Pete, you really are a newbie without a clue as to how the net
works or how networks in general function, aren't you? Your whole
posting had me laughing. I hope your programming skills are better than
your understanding of networks, for your company's sake.

MD

Message-ID: <3h3toh$j4k@floyd.santarosa.edu>
Source record: 25627

Steve Kittelsen (sak1@delphi.com) wrote:
: Is the signal on the 1691 frequency a ATP signal compatible with the WEFAX
: format?

Yes, it is APT typically at 240 LPM.

Now I am wondering if a 5 foot dish will be enough gain to be useful. I'll have to start poking through the old mags to get current sources of gear.

BTW, Alden sez that the imagery is supposed to stop on Friday night, 3 Feb 95. But it is Sunday now and it (a) still here and (b) looks better than last week, but still not what it was a few weeks ago (not enought contrast).

Alden further sez that they are going to 'give' their customers a 28k modem with software (the customer must provide a dedicated phone line and computer) and that they will call and download whatever imagery the customer wants (up to 48 per day). All this for only $250/month. Hello S band?

While it may not have fancy color, I can get what I want for the simple investment of a dish, S Band LNB and a 137 MHz. receiver. I figure <$1k.

Rick

279. Re: Alden WEFAX Move?

Source record: 25628

William Roth (n7ryw@teleport.com) wrote:

: As you heard there, it is digitized and available only if you pay for the
: service. Hacking a descrambler would be quite illegal, of course.

A friend of mine called Alden the other day. He was told that they are going to stop sending the signal on 3 Feb 95 (Friday) night. On Sunday it is still here (and the signal has improved, but still not what it was). So it may quit RSN [uh, Real Soon Now].

They are going to a phone based system (they give you a modem and call you to deliver the images) for $250/month.

S Band is sounding better and better.

What sized dishes are people using and what equipment should I stay away from for successful image taking [GOES West]? I am hoping that I can get by with a 5 foot dish, S band LNB and a 137 MHz. receiver. Comments? Beams work ok too (limited lot size and already have a 10 foot dish)?

I know I can put a third feed on the TVRO dish, but the cost of a used dish isn't much (~5 footer at least) and it will make the family happier if I can go another route (ties up the dish when I get images).

On the other hand, I saw on CIS today that the Weather Channel is starting a new forum. So I joined and asked them if they would like to put the GOES East and West feeds in sub-carriers on their transponder. I figured that the worst they could do is say no. One thing I didn't know was if the sub-carrier would automatically be passed on through a cable system or not (I can get it from the dish). I will report progress (or contact name) here when I get a response. That would at least maintain the status quo if they will be willing. Heck, they can sell the scan cards and sub-carrier receivers to make back what they spend. I did suggest that a sub-carrier above 5 MHz. would be cheaper to the user (the sat. receiver can already get that). As long as it doesn't mess up their contract with wherever they get their image feeds I don't see a problem (NOAA shouldn't care, but Alden would not like it ;-D) We'll see.

Rick

280. APT-Satellites: Report FEB 05, 1995

```
Observed 50.61 deg NLat, 7.55 deg ELon; FEB 05, 1995

Following the satellite-name you read the approx.
hour (local=sun-time) and motion-direction of the
pass (N=northbound, S=southbound).
This time +/-1.5h is valid for the next 10+ days
to expect the satellite to be visible in range of
northern-hemisphere-stations, add 11h and switch
S<->N for another pass to observe.

NOAA-9 11:S APT 137.62 MHz On
NOAA-10 18:N APT 137.50 MHz On
NOAA-12 09:S APT 137.50 MHz On
NOAA-14 14:N APT 137.62 MHz On
Meteor 3-5 12:S APT 137.85 MHz On

Satellites with APT inactive:
NOAA-11 (AVHRR dead) 137.62 MHz
Meteor 2-21 137.85 MHz
Okean 1-7 137.40 MHz

APT of NOAA-10 was active although the satellite is in
standby mode. Quite good images from Meteor 3-5.
NOAA-14 transmits Ch. 2 and 4 during S/C-day, image-quality
is excellent, low noise-level and very good contrast.

From: art_jeyes@jhuapl.edu
Message-ID: <art_jeyes.1142468809A@128.220.101.100>
Source record: 25633

I have connected my Trakbox with version 3.30i ROM to my IC-970 CAT port for automated tuning. However, I have a problem that I need some help with. It appears that the IC-970 only correctly receives a small percentage of the tuning commands and mode change commands that are sent to it. I can see commands going out on the serialline on the O-scope... but the IC-970 doesnt respond. Has anyone got this setup working...? Another ham, KC4KMY, with the same setup is seeing the same problem....

Another trakbox-ism--- if you tell it to correct the uplink frequency for doppler... and the command is correctly received by the IC-970...the trakbox calculates the proper correction, but applies it with the wrong sign... is there a fix for this problem?

Thanks for any and all comments on IC-970/Trakbox...

284. Trakbox to IC-970 interface

Newsgroup: rec.radio.amateur.space
Date: 1995-02-06 15:49:20 UTC
From: art.jeyes@jhuapl.edu
Message-ID: <art.jeyes.1142473400B@128.220.101.100>
Source record: 25634

I have connected my Trakbox with version 3.30i ROM to my IC-970 CAT port for automated tuning. However, I have a problem that I need some help with. It appears that the IC-970 only correctly receives a small percentage of the tuning commands and mode change commands that are sent to it. I can see commands going out on the serialline on the O-scope... but the IC-970 doesnt respond. Has anyone got this setup working...? Another ham, KC4KMY, with the same setup is seeing the same problem....

Another trakbox-ism--- if you tell it to correct the uplink frequency for doppler... and the command is correctly received by the IC-970...the trakbox calculates the proper correction, but applies it with the wrong sign... is there a fix for this problem?

Thanks for any and all comments on IC-970/Trakbox...

: >> 3-4 lbs to 100,000 feet. The 1200 gram size will take a full six
: >> pound payload to 100,000 feet.
: >Is this using hydrogen gas? How does helium compare in lift?

: Yes, it is. Helium will have less lift, so you'll either have to inflate
: the balloon to a larger size to get your payload off the ground, which

: Unfortunately, I don't have any numbers to plug in here. Anybody got
: the formulas for this sort of work?

: Dave, N9LTD

I would like to suggest that because hydrogen is a smaller atom, it
will leak out of the balloon faster (I can't remember my chemistry;
what is the term for dissipating through a membrane? Ossify?).

I think helium will not have as much lift, but more longevity.

288. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-02-07 00:07:24 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.792115644@eel>
Source record: 25638

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

289. RS-15 Info Wanted--

Newsgroup: rec.radio.amateur.space
Date: 1995-02-07 02:09:38 UTC
From: leigh@rain.org
Message-ID: <3h6kp2$54i@news.rain.org>
Source record: 25639

I've worked RS-10 and RS-12 in the past, but know almost nothing about RS-15. What is the uplink frequency for RS-15, and what sort of gear is typically used to work it?

My QTH is in Southern California; what is the extreme range of contacts I can expect from it?

I understand its signal is somewhat weaker than RS-10: can it still be recieved well enough to work with a dipole, or should I have a tracking beam and/or pre-amp?

Thanks. --Leigh/KM6JE in Santa Barbara.

290. Good Keps for RS-15?

Dave Odekirk left a _real nice_ present on the Clear Skies BBS yesterday:

FAA Regulations, Part 101, which covers moored balloons, kites, unmanned rockets and ... unmanned free balloons! I was about one page into typing this puppy and was starting to despair of ever getting it finished.
Many thanks, Dave!

BEGIN --- CUT HERE --- Cut Here --- cut here ---

PART 101--MOORED BALLOONS, KITES, UNMANNED ROCKETS AND UNMANNED FREE BALLOONS

Subpart A--General

Sec.
101.1 Applicability.
101.3 Waivers.
101.5 Operations in prohibited or restricted areas.
101.7 Hazardous operations.

Subpart B--Moored Balloons and Kites

101.11 Applicability.
101.13 Operating limitations.
101.15 Notice requirements.
101.17 Lighting and marking requirements.
101.19 Rapid deflation device.

Subpart C--Unmanned Rockets

101.21 Applicability.
101.22 Special provisions for large model rockets.
101.23 Operating limitations.
101.25 Notice requirements.

Subpart D--Unmanned Free Balloons

101.31 Applicability.
101.33 Operating limitations.
101.35 Equipment and marking requirements.
101.37 Notice requirements.
101.39 Balloon position reports.

Authority: 49 U.S.C. app. 1348, 1354, 1372, 1421, 1442, 1443, 1472, 1510, and 1522.

Subpart A--General

Sec. 101.1 Applicability.

(a) This part prescribes rules governing the operation in the United States, of the following:
(1) Except as provided for in Sec. 101.7, any balloon that is moored to the surface of the earth or an object thereon and that has a diameter of more than 6 feet or a gas capacity of more than 115 cubic feet.
(2) Except as provided for in Sec. 101.7, any kite that weighs more than 5 pounds and is intended to be flown at the end of a rope or cable.
(3) Any unmanned rocket except:
(i) Aerial firework displays; and,
(ii) Model rockets:
(a) Using not more than four ounces of propellant;
(b) Using a slow-burning propellant;
(c) Made of paper, wood, or breakable plastic, containing no substantial metal parts and weighing not more than 16 ounces, including the propellant; and
(d) Operated in a manner that does not create a hazard to persons, property, or other aircraft.
(4) Except as provided for in Sec. 101.7, any unmanned free balloon that--
(i) Carries a payload package that weighs more than four pounds and has a weight/size ratio of more than three ounces per square inch on any surface of the package, determined by dividing the total weight in ounces of the payload package by the area in square inches of its smallest surface;
(ii) Carries a payload package that weighs more than six pounds;
(iii) Carries a payload, of two or more packages, that weighs more than 12 pounds; or
(iv) Uses a rope or other device for suspension of the payload that requires an impact force of more than 50 pounds to separate the suspended payload from the balloon.
(b) For the purposes of this part, a "gyroglider" attached to a vehicle on the surface of the earth is considered to be a kite.

[Doc. No. 1580, 28 FR 6721, June 29, 1963, as amended by Amdt. 101-1, 29 FR 46, Jan. 3, 1964; Amdt. 101-3, 35 FR 8213, May 26, 1970]

Sec. 101.3 Waivers.

No person may conduct operations that require a deviation from this part except under a certificate of waiver issued by the Administrator.

[Doc. No. 1580, 28 FR 6721, June 29, 1963]

Sec. 101.5 Operations in prohibited or restricted areas.

No person may operate a moored balloon, kite, unmanned rocket, or unmanned free balloon in a prohibited or restricted area unless he has permission from the using or controlling agency, as appropriate.

[Amdt. 101-1, 29 FR 46, Jan. 3, 1964]

Sec. 101.7 Hazardous operations.

(a) No person may operate any moored balloon, kite, unmanned rocket, or unmanned free balloon in a manner that creates a hazard to other persons, or their property.

(b) No person operating any moored balloon, kite, unmanned rocket, or unmanned free balloon may allow an object to be dropped therefrom, if such action creates a hazard to other persons or their property.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 12800, Amdt. 101-4, 39 FR 22252, June 21, 1974]

Subpart B--Moored Balloons and Kites

Source: Docket No. 1580, 28 FR 6722 June 29, 1963, unless otherwise noted.

Sec. 101.11 Applicability.

This subpart applies to the operation of moored balloons and kites. However, a person operating a moored balloon or kite within a restricted area must comply only with Sec. 101.19 and with additional limitations imposed by the using or controlling agency, as appropriate.

Sec. 101.13 Operating limitations.

(a) Except as provided in paragraph (b) of this section, no person may operate a moored balloon or kite--
(1) Less than 500 feet from the base of any cloud;
(2) More than 500 feet above the surface of the earth;
(3) From an area where the ground visibility is less than three miles; or
(4) Within five miles of the boundary of any airport.
(b) Paragraph (a) of this section does not apply to the operation of a balloon or kite below the top of any structure and within 250 feet of it, if that shielded operation does not obscure any lighting on the structure.

Sec. 101.15 Notice requirements.

No person may operate an unshielded moored balloon or kite more than 150 feet above the surface of the earth unless, at least 24 hours before beginning the operation, he gives the following information to the FAA ATC facility that is nearest to the place of intended operation:
(a) The names and addresses of the owners and operators.
(b) The size of the balloon or the size and weight of the kite.
(c) The location of the operation.
(d) The height above the surface of the earth at which the balloon or kite is to be operated.
(e) The date, time, and duration of the operation.

Sec. 101.17 Lighting and marking requirements.

(a) No person may operate a moored balloon or kite, between sunset and sunrise unless the balloon or kite, and its mooring lines, are lighted so as to give a visual warning equal to that required for obstructions to air navigation in the FAA publication "Obstruction Marking and Lighting".
(b) No person may operate a moored balloon or kite between sunrise and sunset unless its mooring lines have colored pennants or streamers attached at not more than 50 foot intervals beginning at 150 feet above the surface of the earth and visible for at least one mile.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.19 Rapid deflation device.

No person may operate a moored balloon unless it has a device that will automatically and rapidly deflate the balloon if it escapes from its moorings. If the device does not function properly, the operator shall immediately notify the nearest ATC facility of the location and time of the escape and the estimated flight path of the balloon.

Subpart C--Unmanned Rockets

Source: Docket No. 1580, 28 FR 6722, June 29, 1963, unless otherwise noted.

Sec. 101.21 Applicability.

This subpart applies to the operation of unmanned rockets. However, a person operating an unmanned rocket within a restricted area must comply only with Sec. 101.23(g) and with additional limitations imposed by the using or controlling agency, as appropriate.

Sec. 101.22 Special provisions for large model rockets.

Persons operating model rockets that use not more than 125 grams of propellant; that are made of paper, wood, or breakable plastic; that contain no substantial metal parts, and that weigh not more than 1,500 grams, including the propellant, need not comply with Sec. 101.23 (b), (c), (g), and (h), provided:
(a) That person complies with all provisions of Sec. 101.25; and
(b) The operation is not conducted within 5 miles of an airport runway or other landing area unless the information required in Sec. 101.25 is also provided to the manager of that airport.

[Amdt. 101-6, 59 FR 50393, Oct. 3, 1994]

****

59 FR 50390, No. 190, Oct. 3, 1994

SUMMARY: This action amends the operational guidelines of the Federal Aviation Regulations (FAR) Part 101 for model rockets that: use not more than 125 grams (4.4 ounces) of propellant; are made of paper, wood, or breakable plastic; contain no substantial metal parts; and weigh not more than 1,500 grams (53 ounces). This amendment is necessary to provide for the operation of the technologically advanced, larger category, model rockets and to ensure that their operation is in concert with the maximum level of safety protection for aircraft, flight crews, and the flying public. The FAA believes that this amendment will foster important aeronautical education and research activities, while retaining appropriate operational safety precautions.

EFFECTIVE DATE: November 2, 1994.

****

Sec. 101.23 Operating limitations.

No person may operate an unmanned rocket--
(a) In a manner that creates a collision hazard with other aircraft;
(b) In controlled airspace;
(c) Within five miles of the boundary of any airport;
(d) At any altitude where clouds or obscuring phenomena of more than five-tenths coverage prevails;
(e) At any altitude where the horizontal visibility is less than five miles;
(f) Into any cloud;
(g) Within 1,500 feet of any person or property that is not associated with the operations; or
(h) Between sunset and sunrise.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.25 Notice requirements.

No person may operate an unmanned rocket unless that person gives the following information to the FAA ATC facility nearest to the place of intended operation no less than 24 hours prior to and no more than 48 hours prior to beginning the operation:
(a) The names and addresses of the operators; except when there are multiple participants at a single event, the name and address of the person so designated as the event launch coordinator, whose duties include coordination of the required launch data estimates and coordinating the launch event;
(b) The estimated number of rockets to be operated;
(c) The estimated size and the estimated weight of each rocket; and
(d) The estimated highest altitude or flight level to which each rocket will be operated.
(e) The location of the operation.
(f) The date, time, and duration of the operation.
(g) Any other pertinent information requested by the ATC facility.

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-6, 59 FR 50393, Oct. 3, 1994]

****

59 FR 50390, No. 190, Oct. 3, 1994

Subpart D--Unmanned Free Balloons

Source: Docket No. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, unless otherwise noted.

Sec. 101.31 Applicability.

This subpart applies to the operation of unmanned free balloons. However, a person operating an unmanned free balloon within a restricted area must comply only with Sec. 101.33 (d) and (e) and with any additional limitations that are imposed by the using or controlling agency, as appropriate.

Sec. 101.33 Operating limitations.

No person may operate an unmanned free balloon--
(a) Unless otherwise authorized by ATC, below 2,000 feet above the surface within the lateral boundaries of the surface areas of Class B, Class C, Class D, or Class E airspace designated for an airport;
(b) At any altitude where there are clouds or obscuring phenomena of more than five-tenths coverage;
(c) At any altitude below 60,000 feet standard pressure altitude where the horizontal visibility is less than five miles;
(d) During the first 1,000 feet of ascent, over a congested area of a city, town, or settlement or an open-air assembly of persons not associated with the operation; or
(e) In such a manner that impact of the balloon, or part thereof including its payload, with the surface creates a hazard to persons or property not associated with the operation.

[Dkt. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-5, 56 FR 65662, Dec. 17, 1991]

EFFECTIVE DATE NOTE: Amdt. 101-5, 56 FR 65662, Dec. 17, 1991, revised paragraph (a) of Sec. 101.33 effective September 16, 1993. For the convenience of the user, the superseded text in effect until Sept. 16, 1993, is set forth as follows:

Sec. 101.33 Operating limitations.

* * * * *

(a) Unless otherwise authorized by ATC, in a control zone below 2,000 feet above the surface, or in an airport traffic area;

****

56 FR 65638, No. 242, Dec. 17, 1991

SUMMARY: This final rule amends the Federal Aviation Regulations (FAR) to adopt certain recommendations of the National Airspace Review (NAR) concerning changes to regulations and procedures in regard to airspace classifications. These changes are intended to: (1) Simplify airspace designations; (2) achieve international commonality of airspace designations; (3) increase standardization of equipment requirements for operations in various classifications of airspace; (4) describe appropriate pilot certificate requirements, visual flight rules (VFR) visibility and distance from cloud rules, and air traffic services offered in each class of airspace; and (5) satisfy the responsibilities of the United States as a member of the International Civil Aviation Organization (ICAO). The final rule also amends the requirement for minimum distance from clouds in certain airspace areas and the requirements for communications with air traffic control (ATC) in certain airspace areas; eliminates airport radar service areas (ARSAs), control zones, and terminal control areas (TCAs) as airspace classifications; and eliminates the term "airport traffic area." The FAA believes simplified airspace classifications will reduce existing airspace complexity and thereby enhance safety.

EFFECTIVE DATE: These regulations become effective September 16, 1993, except that Secs. 11.61(c), 91.215(d), 71.601, 71.603, 71.605, 71.607, and 71.609 and Part 75 become effective December 12, 1991, and except that amendatory instruction number 20, Sec. 71.1, is effective as of December 17, 1991 through September 15, 1993, and that Secs. 71.11 and 71.19 become effective October 15, 1992. The incorporation by reference of FAA Order 7400.7 in Sec. 71.1 (amendatory instruction number 20) is approved by the Director of the Federal Register as of December 17, 1991, through September 15, 1993. The incorporation by reference of FAA Order 7400.9 in Sec. 71.1 (amendatory instruction number 24) is approved by the Director of the Federal Register as of September 16, 1993 through September 15, 1994.

****

Sec. 101.35 Equipment and marking requirements.

(a) No person may operate an unmanned free balloon unless--
(1) It is equipped with at least two payload cut-down systems or devices that operate independently of each other;
(2) At least two methods, systems, devices, or combinations thereof, that function independently of each other, are employed for terminating the flight of the balloon envelope; and
(3) The balloon envelope is equipped with a radar reflective device(s) or material that will present an echo to surface radar operating in the 200 MHz to 2700 MHz frequency range.

The operator shall activate the appropriate devices required by paragraphs (a) (1) and (2) of this section when weather conditions are less than those prescribed for operation under this subpart, or if a malfunction or any other reason makes the further operation hazardous to other air traffic or to persons and property on the surface.
(b) No person may operate an unmanned free balloon below 60,000 feet

standard pressure altitude between sunset and sunrise (as corrected to the altitude of operation) unless the balloon and its attachments and payload, whether or not they become separated during the operation, are equipped with lights that are visible for at least 5 miles and have a flash frequency of at least 40, and not more than 100, cycles per minute.
(c) No person may operate an unmanned free balloon that is equipped with a trailing antenna that requires an impact force of more than 50 pounds to break it at any point, unless the antenna has colored pennants or streamers that are attached at not more than 50 foot intervals and that are visible for at least one mile.
(d) No person may operate between sunrise and sunset an unmanned free balloon that is equipped with a suspension device (other than a highly conspicuously colored open parachute) more than 50 feet along, unless the suspension device is colored in alternate bands of high conspicuity colors or has colored pennants or streamers attached which are visible for at least one mile.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-2, 32 FR 5254, Mar. 29, 1967; Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.37 Notice requirements.

(a) Prelaunch notice: Except as provided in paragraph (b) of this section, no person may operate an unmanned free balloon unless, within 6 to 24 hours before beginning the operation, he gives the following information to the FAA ATC facility that is nearest to the place of intended operation:
(1) The balloon identification.
(2) The estimated date and time of launching, amended as necessary to remain within plus or minus 30 minutes.
(3) The location of the launching site.
(4) The cruising altitude.
(5) The forecast trajectory and estimated time to cruising altitude or 60,000 feet standard pressure altitude, whichever is lower.
(6) The length and diameter of the balloon, length of the suspension device, weight of the payload, and length of the trailing antenna.
(7) The duration of flight.
(8) The forecast time and location of impact with the surface of the earth.
(b) For solar or cosmic disturbance investigations involving a critical time element, the information in paragraph (a) of this section shall be given within 30 minutes to 24 hours before beginning the operation.
(c) Cancellation notice: If the operation is canceled, the person who intended to conduct the operation shall immediately notify the nearest FAA ATC facility.
(d) Launch notice: Each person operating an unmanned free balloon shall notify the nearest FAA or military ATC facility of the launch time immediately after the balloon is launched.

Sec. 101.39 Balloon position reports.

(a) Each person operating an unmanned free balloon shall:
(1) Unless ATC requires otherwise, monitor the course of the balloon and record its position at least every two hours; and
(2) Forward any balloon position reports requested by ATC.
(b) One hour before beginning descent, each person operating an unmanned free balloon shall forward to the nearest FAA ATC facility the following information regarding the balloon:
(1) The current geographical position.
(2) The altitude.
(3) The forecast time of penetration of 60,000 feet standard pressure altitude (if applicable).
(4) The forecast trajectory for the balance of the flight.
(5) The forecast time and location of impact with the surface of the earth.
(c) If a balloon position report is not recorded for any two-hour period of flight, the person operating an unmanned free balloon shall immediately notify the nearest FAA ATC facility. The notice shall include the last recorded position and any revision of the forecast trajectory. The nearest FAA ATC facility shall be notified immediately when tracking of the balloon is re-established.
(d) Each person operating an unmanned free balloon shall notify the nearest FAA ATC facility when the operation is ended.

PART 101--MOORED BALLOONS, KITES, UNMANNED ROCKETS AND UNMANNED FREE BALLOONS

Subpart A--General

Sec.
101.1 Applicability.
101.3 Waivers.
101.5 Operations in prohibited or restricted areas.
101.7 Hazardous operations.

Subpart B--Moored Balloons and Kites

101.11 Applicability.
101.13 Operating limitations.
101.15 Notice requirements.
101.17 Lighting and marking requirements.
101.19 Rapid deflation device.

Subpart C--Unmanned Rockets

101.21 Applicability.
101.22 Special provisions for large model rockets.
101.23 Operating limitations.

101.25 Notice requirements.

Subpart D--Unmanned Free Balloons

101.31 Applicability.
101.33 Operating limitations.
101.35 Equipment and marking requirements.
101.37 Notice requirements.
101.39 Balloon position reports.

Authority: 49 U.S.C. app. 1348, 1354, 1372, 1421, 1442, 1443, 1472, 1510, and 1522.

Subpart A--General

Sec. 101.1 Applicability.

(a) This part prescribes rules governing the operation in the United States, of the following:
(1) Except as provided for in Sec. 101.7, any balloon that is moored to the surface of the earth or an object thereon and that has a diameter of more than 6 feet or a gas capacity of more than 115 cubic feet.
(2) Except as provided for in Sec. 101.7, any kite that weighs more than 5 pounds and is intended to be flown at the end of a rope or cable.
(3) Any unmanned rocket except:
(i) Aerial firework displays; and,
(ii) Model rockets:
(a) Using not more than four ounces of propellant;
(b) Using a slow-burning propellant;
(c) Made of paper, wood, or breakable plastic, containing no substantial metal parts and weighing not more than 16 ounces, including the propellant; and
(d) Operated in a manner that does not create a hazard to persons, property, or other aircraft.
(4) Except as provided for in Sec. 101.7, any unmanned free balloon that--
(i) Carries a payload package that weighs more than four pounds and has a weight/size ratio of more than three ounces per square inch on any surface of the package, determined by dividing the total weight in ounces of the payload package by the area in square inches of its smallest surface;
(ii) Carries a payload package that weighs more than six pounds;
(iii) Carries a payload, of two or more packages, that weighs more than 12 pounds; or
(iv) Uses a rope or other device for suspension of the payload that requires an impact force of more than 50 pounds to separate the suspended payload from the balloon.
(b) For the purposes of this part, a "gyroglider" attached to a vehicle on the surface of the earth is considered to be a kite.

[Doc. No. 1580, 28 FR 6721, June 29, 1963, as amended by Amdt. 101-1, 29 FR 46, Jan. 3, 1964; Amdt. 101-3, 35 FR 8213, May 26, 1970]

Sec. 101.3 Waivers.

No person may conduct operations that require a deviation from this part except under a certificate of waiver issued by the Administrator.

[Doc. No. 1580, 28 FR 6721, June 29, 1963]

Sec. 101.5 Operations in prohibited or restricted areas.

No person may operate a moored balloon, kite, unmanned rocket, or unmanned free balloon in a prohibited or restricted area unless he has permission from the using or controlling agency, as appropriate.

[Amdt. 101-1, 29 FR 46, Jan. 3, 1964]

Sec. 101.7 Hazardous operations.

(a) No person may operate any moored balloon, kite, unmanned rocket, or unmanned free balloon in a manner that creates a hazard to other persons, or their property.
(b) No person operating any moored balloon, kite, unmanned rocket, or unmanned free balloon may allow an object to be dropped therefrom, if such action creates a hazard to other persons or their property.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 12800, Amdt. 101-4, 39 FR 22252, June 21, 1974]

Subpart B--Moored Balloons and Kites

Source: Docket No. 1580, 28 FR 6722 June 29, 1963, unless otherwise noted.

Sec. 101.11 Applicability.

This subpart applies to the operation of moored balloons and kites. However, a person operating a moored balloon or kite within a restricted area must comply only with Sec. 101.19 and with additional limitations imposed by the using or controlling agency, as appropriate.

Sec. 101.13 Operating limitations.

(a) Except as provided in paragraph (b) of this section, no person may operate a moored balloon or kite--
(1) Less than 500 feet from the base of any cloud;
(2) More than 500 feet above the surface of the earth;
(3) From an area where the ground visibility is less than three miles; or
(4) Within five miles of the boundary of any airport.
(b) Paragraph (a) of this section does not apply to the operation of a balloon or kite below the top of any structure and within 250 feet of it, if that shielded operation does not obscure any lighting on the structure.

Sec. 101.15 Notice requirements.

No person may operate an unshielded moored balloon or kite more than 150 feet above the surface of the earth unless, at least 24 hours before beginning the operation, he gives the following information to the FAA ATC facility that is nearest to the place of intended operation:
(a) The names and addresses of the owners and operators.

(b) The size of the balloon or the size and weight of the kite.
(c) The location of the operation.
(d) The height above the surface of the earth at which the balloon or kite is to be operated.
(e) The date, time, and duration of the operation.

Sec. 101.17 Lighting and marking requirements.

(a) No person may operate a moored balloon or kite, between sunset and sunrise unless the balloon or kite, and its mooring lines, are lighted so as to give a visual warning equal to that required for obstructions to air navigation in the FAA publication "Obstruction Marking and Lighting".
(b) No person may operate a moored balloon or kite between sunrise and sunset unless its mooring lines have colored pennants or streamers attached at not more than 50 foot intervals beginning at 150 feet above the surface of the earth and visible for at least one mile.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.19 Rapid deflation device.

No person may operate a moored balloon unless it has a device that will automatically and rapidly deflate the balloon if it escapes from its moorings. If the device does not function properly, the operator shall immediately notify the nearest ATC facility of the location and time of the escape and the estimated flight path of the balloon.

Subpart C--Unmanned Rockets

Source: Docket No. 1580, 28 FR 6722, June 29, 1963, unless otherwise noted.

Sec. 101.21 Applicability.

This subpart applies to the operation of unmanned rockets. However, a person operating an unmanned rocket within a restricted area must comply only with Sec. 101.23(g) and with additional limitations imposed by the using or controlling agency, as appropriate.

Sec. 101.22 Special provisions for large model rockets.

Persons operating model rockets that use not more than 125 grams of propellant; that are made of paper, wood, or breakable plastic; that contain no substantial metal parts, and that weigh not more than 1,500 grams, including the propellant, need not comply with Sec. 101.23 (b), (c), (g), and (h), provided:
(a) That person complies with all provisions of Sec. 101.25; and
(b) The operation is not conducted within 5 miles of an airport runway or other landing area unless the information required in Sec. 101.25 is also provided to the manager of that airport.

[Amdt. 101-6, 59 FR 50393, Oct. 3, 1994]

****

59 FR 50390, No. 190, Oct. 3, 1994

SUMMARY: This action amends the operational guidelines of the Federal Aviation Regulations (FAR) Part 101 for model rockets that: use not more than 125 grams (4.4 ounces) of propellant; are made of paper, wood, or breakable plastic; contain no substantial metal parts; and weigh not more than 1,500 grams (53 ounces). This amendment is necessary to provide for the operation of the technologically advanced, larger category, model rockets and to ensure that their operation is in concert with the maximum level of safety protection for aircraft, flight crews, and the flying public. The FAA believes that this amendment will foster important aeronautical education and research activities, while retaining appropriate operational safety precautions.

EFFECTIVE DATE: November 2, 1994.

****

Sec. 101.23 Operating limitations.

No person may operate an unmanned rocket--
(a) In a manner that creates a collision hazard with other aircraft;
(b) In controlled airspace;
(c) Within five miles of the boundary of any airport;
(d) At any altitude where clouds or obscuring phenomena of more than five-tenths coverage prevails;
(e) At any altitude where the horizontal visibility is less than five miles;
(f) Into any cloud;
(g) Within 1,500 feet of any person or property that is not associated with the operations; or
(h) Between sunset and sunrise.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.25 Notice requirements.

No person may operate an unmanned rocket unless that person gives the following information to the FAA ATC facility nearest to the place of intended operation no less than 24 hours prior to and no more than 48 hours prior to beginning the operation:
(a) The names and addresses of the operators; except when there are multiple participants at a single event, the name and address of the person so designated as the event launch coordinator, whose duties include coordination of the required launch data estimates and coordinating the launch event;
(b) The estimated number of rockets to be operated;
(c) The estimated size and the estimated weight of each rocket; and
(d) The estimated highest altitude or flight level to which each rocket

will be operated.
(e) The location of the operation.
(f) The date, time, and duration of the operation.
(g) Any other pertinent information requested by the ATC facility.

[Doc. No. 1580, 28 FR 6722, June 29, 1963, as amended by Amdt. 101-6, 59 FR 50393, Oct. 3, 1994]

Subpart D--Unmanned Free Balloons

Source: Docket No. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, unless otherwise noted.

Sec. 101.31 Applicability.

This subpart applies to the operation of unmanned free balloons. However, a person operating an unmanned free balloon within a restricted area must comply only with Sec. 101.33 (d) and (e) and with any additional limitations that are imposed by the using or controlling agency, as appropriate.

Sec. 101.33 Operating limitations.

No person may operate an unmanned free balloon--
(a) Unless otherwise authorized by ATC, below 2,000 feet above the surface within the lateral boundaries of the surface areas of Class B, Class C, Class D, or Class E airspace designated for an airport;
(b) At any altitude where there are clouds or obscuring phenomena of more than five-tenths coverage;
(c) At any altitude below 60,000 feet standard pressure altitude where the horizontal visibility is less than five miles;
(d) During the first 1,000 feet of ascent, over a congested area of a city, town, or settlement or an open-air assembly of persons not associated with the operation; or
(e) In such a manner that impact of the balloon, or part thereof including

its payload, with the surface creates a hazard to persons or property not associated with the operation.

[Dkt. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-5, 56 FR 65662, Dec. 17, 1991]

EFFECTIVE DATE NOTE: Amdt. 101-5, 56 FR 65662, Dec. 17, 1991, revised paragraph (a) of Sec. 101.33 effective September 16, 1993. For the convenience of the user, the superseded text in effect until Sept. 16, 1993, is set forth as follows:

Sec. 101.33 Operating limitations.

* * * * *

(a) Unless otherwise authorized by ATC, in a control zone below 2,000 feet above the surface, or in an airport traffic area;

****

56 FR 65638, No. 242, Dec. 17, 1991

SUMMARY: This final rule amends the Federal Aviation Regulations (FAR) to adopt certain recommendations of the National Airspace Review (NAR) concerning changes to regulations and procedures in regard to airspace classifications. These changes are intended to: (1) Simplify airspace designations; (2) achieve international commonality of airspace designations; (3) increase standardization of equipment requirements for operations in various classifications of airspace; (4) describe appropriate pilot certificate requirements, visual flight rules (VFR) visibility and distance from cloud rules, and air traffic services offered in each class of airspace; and (5) satisfy the responsibilities of the United States as a member of the International Civil Aviation Organization (ICAO). The final rule also amends the requirement for minimum distance from clouds in certain airspace areas and the requirements for communications with air traffic control (ATC) in certain airspace areas; eliminates airport radar service areas (ARSAs), control zones, and terminal control areas (TCAs) as airspace classifications; and eliminates the term "airport traffic area." The FAA believes simplified airspace classifications will reduce existing airspace complexity and thereby enhance safety.

EFFECTIVE DATE: These regulations become effective September 16, 1993, except that Secs. 11.61(c), 91.215(d), 71.601, 71.603, 71.605, 71.607, and 71.609 and Part 75 become effective December 12, 1991, and except that amendatory instruction number 20, Sec. 71.1, is effective as of December 17, 1991 through September 15, 1993, and that Secs. 71.11 and 71.19 become effective October 15, 1992. The incorporation by reference of FAA Order 7400.7 in Sec. 71.1 (amendatory instruction number 20) is approved by the Director of the Federal Register as of December 17, 1991, through September 15, 1993. The incorporation by reference of FAA Order 7400.9 in Sec. 71.1 (amendatory instruction number 24) is approved by the Director of the Federal Register as of September 16, 1993 through September 15, 1994.

****

Sec. 101.35 Equipment and marking requirements.

(a) No person may operate an unmanned free balloon unless--
(1) It is equipped with at least two payload cut-down systems or devices that operate independently of each other;
(2) At least two methods, systems, devices, or combinations thereof, that function independently of each other, are employed for terminating the flight of the balloon envelope; and
(3) The balloon envelope is equipped with a radar reflective device(s) or material that will present an echo to surface radar operating in the 200 MHz to 2700 MHz frequency range.

The operator shall activate the appropriate devices required by paragraphs (a) (1) and (2) of this section when weather conditions are less than those prescribed for operation under this subpart, or if a malfunction or any other reason makes the further operation hazardous to other air traffic or to persons and property on the surface.
(b) No person may operate an unmanned free balloon below 60,000 feet standard pressure altitude between sunset and sunrise (as corrected to the altitude of operation) unless the balloon and its attachments and payload, whether or not they become separated during the operation, are equipped with lights that are visible for at least 5 miles and have a flash frequency of at least 40, and not more than 100, cycles per minute.
(c) No person may operate an unmanned free balloon that is equipped with a trailing antenna that requires an impact force of more than 50 pounds to break it at any point, unless the antenna has colored pennants or streamers that are attached at not more than 50 foot intervals and that are visible for at least one mile.
(d) No person may operate between sunrise and sunset an unmanned free balloon that is equipped with a suspension device (other than a highly conspicuously colored open parachute) more than 50 feet along, unless the suspension device is colored in alternate bands of high conspicuity colors or has colored pennants or streamers attached which are visible for at least one mile.

(Sec. 6(c), Department of Transportation Act (49 U.S.C. 1655(c)))

[Doc. No. 1457, Amdt. 101-1, 29 FR 47, Jan. 3, 1964, as amended by Amdt. 101-2, 32 FR 5254, Mar. 29, 1967; Amdt. 101-4, 39 FR 22252, June 21, 1974]

Sec. 101.37 Notice requirements.

(a) Prelaunch notice: Except as provided in paragraph (b) of this section, no person may operate an unmanned free balloon unless, within 6 to 24 hours before beginning the operation, he gives the following information to the FAA ATC facility that is nearest to the place of intended operation:
(1) The balloon identification.
(2) The estimated date and time of launching, amended as necessary to remain within plus or minus 30 minutes.
(3) The location of the launching site.
(4) The cruising altitude.

(5) The forecast trajectory and estimated time to cruising altitude or 60,000 feet standard pressure altitude, whichever is lower.
(6) The length and diameter of the balloon, length of the suspension device, weight of the payload, and length of the trailing antenna.
(7) The duration of flight.
(8) The forecast time and location of impact with the surface of the earth.
(b) For solar or cosmic disturbance investigations involving a critical time element, the information in paragraph (a) of this section shall be given within 30 minutes to 24 hours before beginning the operation.
(c) Cancellation notice: If the operation is canceled, the person who intended to conduct the operation shall immediately notify the nearest FAA ATC facility.
(d) Launch notice: Each person operating an unmanned free balloon shall notify the nearest FAA or military ATC facility of the launch time immediately after the balloon is launched.

Sec. 101.39 Balloon position reports.

(a) Each person operating an unmanned free balloon shall:
(1) Unless ATC requires otherwise, monitor the course of the balloon and record its position at least every two hours; and
(2) Forward any balloon position reports requested by ATC.
(b) One hour before beginning descent, each person operating an unmanned free balloon shall forward to the nearest FAA ATC facility the following information regarding the balloon:
(1) The current geographical position.
(2) The altitude.
(3) The forecast time of penetration of 60,000 feet standard pressure altitude (if applicable).
(4) The forecast trajectory for the balance of the flight.
(5) The forecast time and location of impact with the surface of the earth.
(c) If a balloon position report is not recorded for any two-hour period of flight, the person operating an unmanned free balloon shall immediately notify the nearest FAA ATC facility. The notice shall include the last recorded position and any revision of the forecast trajectory. The nearest FAA ATC facility shall be notified immediately when tracking of the balloon is re-established.
(d) Each person operating an unmanned free balloon shall notify the nearest FAA ATC facility when the operation is ended.

292. Spartan Packet Radio Experiment

Newsgroup: rec.radio.amateur.space
Date: 1995-02-07 04:45:49 UTC
From: tedwards@Glue.umd.edu
Message-ID: <3h6ttt$7rm@reggae.src.umd.edu>
Source record: 25642

Information about the Spartan Packet Radio Experiment is available from URL
http://w3eax.umd.edu/spre.html

SPRE will be attached to the SPARTAN spaceframe this month, and is targetted
for launch on the Shuttle in late '95.

The Spartan Packet Radio Experiment (SPRE) is an amateur radio (HAM
radio) communications experiment. This experiment is being developed
and built by the University of Maryland Amateur Radio Association with
assistance from volunteer engineers from Martin Marietta and NASA.

Objectives:

* Test packet radio protocol enhancements for LEO satellite
communications.
* Test a GPS and packet radio based tracking system.
* Provide telemetry for the REFLEX with a command uplink capability.
* Provide an unique hands-on educational opportunity for college
students.
* Provide an educational tool to help inspire elementary and high
school students to pursue science and engineering.

Description:

The SPRE hardware consists of an electronics box and two antenna
arrays. The electronics box contains the SPRE computer, packet terminal
node controller (TNC - modem like device), and two radios. The antenna
arrays are VHF patch antennas that are mounted on opposite sides of the
spacecraft.

SPRE will test a tracking system using packet radio and GPS
information. Ground stations will transmit their locations to SPRE.
SPRE will relay this back to earth. We have developed a software
package that will plot out on a map the locations of these stations.
This system can track mobile ground stations as well as the satellite
itself. Part of this experiment will involve both elementary and high
school students.

Telemetry from the REFLEX is transmitted to earth by the SPRE. This
telemetry will be used by the REFLEX experimenters to provide feedback
on how well their experiment is performing. SPRE also provides an
encrypted command uplink capability to be able to tweak REFLEX if
required.

The SPRE project consists of students and volunteers. All of the hardware and software has been designed and put together by these students and volunteers. This low cost project provides a very good hands-on opportunity to get real world work experience and do something really fun.

>will leak out of the balloon faster (I can't remember my chemistry;
>what is the term for dissipating through a membrane? Ossify?).

>I think helium will not have as much lift, but more longevity.

SO?
A balloon lasts at most 4 hours. Your hydrogen leakage will be minor compared
to that when the thing bursts.

: and is something all satellite operators should strive for anyway.

What does spin modulation of the noise floor
sound like on an FM receiver? I would have
thought that most of this is amplitude modulation
that high quality FM receivers are suppose to reject.

This morning on the second pass, I listened for the Shuttle again, with no success. The packet BBS on MIR was going full blast on 145.550 with the same messages it had last evening. In addition, local QRM from automatic packet stations trying to connect was nearly continuous.

Are the American astronauts operating on another frequency? I read somewhere that they would be operating on voice today and that there was not a packet setup on board, but if they are on the air I couldn't tell.

I'm not sure but you can try 7184 or 7185 KHz. w3nan retransmit the shuttle audio.

If you used *atomic* hydrogen, your statement would be correct.
However, *atomic* hydrogen is unstable, so you will be using
the diatomic molecule H2 instead. That molecule is quite a bit
larger than, and diffuses less readily than, helium atoms. Helium,
being a noble gas, doesn't form into molecules. H2 is 2 AMU while
He is 4 AMU, so the hydrogen will have roughly twice the lift of
helium.

You may try telneting into oig1.gsfc.nasa.gov the logname is oig and the password is goddard1. You can then get to a point that you can enter your name and password (just follow the directions at that point). You then answer a questionaire.

You can send the file containing the elements to your location by a variety of means (FTP too, but that is a little backwards even though it works). The kep file for amateur related birds is called amateur.dat but there are several that are grouped together (weather, amateur, visible, navigatn, etc.).

I haven't been into it for a few months, but it has all you need except the software to do the tracking. There is a list of files available, I suggest that you download that to save on line time (even though it is free).

Happy tracking,

Rick

>
>Who nows where to obtain information about the METEOSAT satellites.
>Information such as frequencies, type of transmission and other stuff.

Harry, try 1691.0 MHz for Meteosat-5, channel 1, and 1694.5 MHz for
channel 2. I'm using these frequencies to get APT transmissions from
Meteosat-5 every day. On channel 1, you'll find typical on-line Meteosat-5
images, whereas on channel 2, they send a lot of transmissions from other
geostationary weather satellites. Channel 1 is busier than channel 2.
Hope that helps, Klaus (Koeln, Germany).

You will need Lower Side Band. The Goddard Amateur Radio Club transmits the shuttle audio on several frequencies: 3.860, 7.185, 14.295, 21.395, and 28.650 if the band is open. They are located near Washington, DC. I get them well in New York City on 3.860 at night and 7.185 days. Good Luck. Oh, they also give Keplerian elements to track the shuttle.

>
> Tom Randall
> KB2SMS

No, SAREX is NOT being carried aboard the shuttle. They are using an imitation of our antenna. The only SAREX part they are using is the window frame for our cavity antenna.

The radio they are using is capable of TX/RX in the ham bands and will be used on future flights as Config "M." (sts-71)

There are no planned SAREX activities on this flight (even though we have several hams onboard) -- well, we might test the radio again later this week.

Any other Q's?

The 2x lift makes sense to me, but others have reported that He has 4% and
8% less lift than H2. I don't understand why so little difference.

From: KKEYSEEA@EUROPA.UMUC.EDU
Message-ID: <3hbn9b$rcv@nova.umuc.edu>
Source record: 25711

On RS-15 passes the last two days, I have noticed that RS-15
is displaying intermittant operation. Both the beacon and the
transponder passband is on for about 10 seconds, then off for about
30 seconds. The beacon makes a noticable "chirp" when it comes back
on. Has anyone else had that experience and/or know what this means
regarding the status of RS-15?

It seems the intermittant operation may not occur near AOS
and LOS at my QTH in Maryland. It makes me wonder if the satellite
has some feature to shut off if excessive uplink power is used....

Any observations or comments?

de WB4U
ops from Gaithersburg MD

(P.S. My CW downlink is OK with 50 Watts uplink through a vertical)

Dave, that W6-land contact into England via RS-15 is very impressive! I listened to RS-15 for the first time a couple of nights ago, and only heard the US midwest. Sadly, the signal of RS-15 is weaker than either RS-10 or 12, and the "hash" noise from computers in my apartment building made it hard to copy many of the operators.

The equipment aboard is not sarex exactly. It is the same type of
equipment, but pre tuned for the frequencies used for the Mir comms.

The radio is tunable, but its front end and the antenna are both set up
for non-amateur frequencies, so actual operation on 145.55 is in doubt.
There may be a chance that they will try it, but I wouldn't hold out
much hope. I have tuned similar radios and antennas, and they don't work
very well outside of their tuned range.

>someone please post the discoveries KEP's?

Qualified sort-of.

Discovery's STS-63 mission is carrying a VHF radio which was used for the direct Shuttle-to-Mir tranmissions. It's a Motorola UR 200, fairly large and heavy radio. For this mission an internal antenna is being used, similar to the SAREX Window 1-6 antenna - although not identical. Most importantly it is *NOT* tuneable.

Some estimates indicate that you'll need a moonbounce station to be able to get a readable signal though ...

Mike Foale (and sorry Mike - I forgot your call sign!) has indicated that he is interested in making random ham contacts after the Mir rendezvous portion is completed (which happened yesterday).

By definition the contacts will be only random voice QSOs (no packet mode). He will use the normal SAREX operating frequencies.

But try anway - it's worth the effort.

Next SAREX mission - STS-67 March 1995 with Dr. Ron Parise WA4SIR and five other hams!

317. <ad> GUARANTEED CREDIT REPAIR BY LAW FIRM

Newsgroup: rec.radio.amateur.space
Date: 1995-02-09 10:47:19 UTC
From: ccapc@cyber.sell.com
Message-ID: <3hcrrn$o88@panix.com>
Source record: 25717

Consumer Credit Advocates, PC
11 Pennsylvania Plaza, Suite 2101
New York, NY 10001
(212) 629-5261 (telephone) (212) 629-4762 (fax)
E-MAIL: ccapc@cyber.sell.com

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

318. need satellite schedules (AO13)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-09 16:14:40 UTC
From: sherwood@oribi.cig.mot.com
Message-ID: <3hdf1g$dh5@delphinium.cig.mot.com>
Source record: 25718

Can someone tell me where I can find schedules?? A schedule tells
when a satellite such as AO13 changes from mode B to mode S and
back again. I have tried the sites specified in the following posting,
but no luck there. I would prefer an internet site, but a BSS will do.
Thanks.

Kenneth L. Keyseear writes:

On RS-15 passes the last two days, I have noticed that RS-15 is
displaying intermittant operation. Both the beacon and the
transponder passband is on for about 10 seconds, then off for about 30
seconds. .....

Yes, I have noticed this. So has K4ADK. I saw it on a 0200Z pass
on 8 Feb. I haven't had a chance to listen to the bird since. Both K4ADK
and I speculated that it might be a "notch" feature in operation. Some
signals I could hear on the downlink seemed quite loud and consistent,
however, so the situation is far from clear to me.
If the RS command team isn't on this mailing list, I hope someone
will forward these observations to them.

There is some doppler spreading of the received noise to the
transponder when repeated, caused by the spin, and that gives
a pumping sound similar to what you hear with a SSB receiver,
but it is very small, and would be hard to hear on an FM receiver
that suppresses AM. But remember you should be well below
the receiver limiting threshold, so some types of FM detector
would have an AM response under this condition. (That wouldn't
be a very desirable type of FM detector to use for satellite
communications though.)

I don't really expect someone with just an FM receiver to hear the
spin modulation of the noise floor, however. Rather I was intending
to indicate the kind of receiving sensitivity needed, and that it
should be good enough, if you had an SSB detector, to hear the noise
floor pump. (Kind of hard for the guy with just an FM receiver to
test that, I'll admit.)

Gary

>
>The 2x lift makes sense to me, but others have reported that He has 4% and
>8% less lift than H2. I don't understand why so little difference.

The main reason is that the above ignores the mass of the balloon
envelope. That's constant for either gas, and greater than the mass
of either gas for small balloons. So it dominates the lift equation.

Since volume increases with the cube of the balloon radius, and
area only increases as the square of the radius, the difference
in lifting gases becomes more pronounced as balloon size increases.
When you approach the size of something like a zepplin, the difference
is quite marked. At weather balloon sizes, it's not so pronounced.

Gary

But gaseous hydrogen is molecular (H-sub-2) whereas helium is atomic.
This somewhat ameliorates the problem. That is, the mass ratio is
2:4, not 1:4.

I noticed it too. Sorry that I don't remember exactly when, except
that it was within the last several days, and I believe the sat was
close to max elevation for me.

Gee, I hope it's not dying already!

Anyone else noticed that official news about this satellite
is extremely scarce? The ARRL, AMSAT, and the satellite news bulletin
that gets posted here have said hardly a thing about it. I for one
would be interested in learning about the prospects for full power
from the translator; is it just turned down for some reason, or is it
broken?

I have noticed the same thing. I E-Mailed the RS Group and, at first, they told me that it was propagation or spin modulation. I noticed it again last night and E-Mailed them again. Leo, at the RS Group, told me it may be a low-voltage condition during its eclipse with the earth. The RS Group can be E-Mailed at: rsgroup@olymp.msk.su

>power budget.

I doubt that there would be a way to "Limit" FM if it got started. The passband would be filled with just a few signals, and few of those would be able to tune for Doppler properly. Most would be mobile radios, with their 5 kHz steps. With differing Doppler for different stations, they would end up overlapping.

The most compelling reason, though, for not wanting FM is conservation of bandwidth. In the 15+kHz of a single FM signal, five 3 kHz SSB signals can be carried. I would not want to see this satellites' resources wasted by using FM there.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Ken,

I noticed the same thing on passes on 7 February. Was sure, at first, that
it was my 10 meter downlink antenna. Recived confirmation from other users
that is was common to all users. Have we got another broken satellite?

Ned

If I remember my chemistry:

Air is mostly Nitrogen, Atomic Wt = 7, Molecular Wt = 14 (N2)
(use 14.4 for the 20% Oxygen=8)

Hydrogen Atomic Wt = 1 Molecule is H2, molecular weight = 2

Helium Atomic Wt = 2 Molecule is He (inert gas) mol wt = 2 also

Gasses fill a volume to a constant number of molecules per volume at
a given pressure and temperature, remember P*V=N*R*T. I forget whos law.

Your lifting power is proportional to the difference in the molecular
weights, which is identical. Helium is probably a lot more expensive
but a lot safer (Hindenberg).

Message-ID: <1995Feb10.151954.29230@ke4zv.atl.ga.us>
Source record: 25742

Let me retract some erroneous information I posted previously.
H2 has an AMU of 2, and helium has an AMU of 4, but that doesn't
mean the lift will be 2x greater. What counts for lift is the
difference in the mass of light displacing gas vis the mass of the
atmosphere. Air is 80% N2 with an AMU of 28, and 20% O2 with
an AMU of 32. So air has an average AMU of 28.8. Now the lift
for a given volume of lifting gas will be air-gas. In the case
of hydrogen, the number is 28.8-2=26.8, and for helium it is
28.8-4=24.8. So hydrogen lifts 26.8/24.8=1.08 times as much,
or an 8% greater lift.

Thanks to Ross Alexander for putting me straight on this.

I think you are exaggerating transponder loading. The transponders
are rarely approaching full. However, I agree that lots of FM operation
would be bad. All I wanted to say was that usable FM signals should
be *possible* through P3D without adversely impacting its power budget.
I don't want to leave the impression that I think a lot of such operations
would be desirable on other counts.

339. More Info on INTERMITTANT RS-15 de WB4U

Newsgroup: rec.radio.amateur.space
Date: 1995-02-10 16:51:53 UTC
From: KKEYSEEA@EUROPA.UMUC.EDU
Message-ID: <3hg5j9$bjv@nova.umuc.edu>
Source record: 25749

While observing RS-15 during Orbit #64, the beacon and transponder were operating fine at AOS. Shortly thereafter, the intermittant characteristic discussed earlier began. Then, the beacon and transponder abruptly became solid again. Since the pass was in the early morning hours, I tried a theory that the solid operation occurred after the satellite passed into the sunlight. YEP, just as the satellite was illuminated by the sun, according to STSPLUS, the operation became solid....

Apparently the amateur side of RS-15 is shut off when the power budget of the overall satellite is low. (Like in the shade and over the high-access U. S.)

So, to plan for enjoyable RS-15 ops, make sure the satellite is in sunlight for the anticipated pass.

[Caveat: One observation does not prove a theory. Continued observations and comments will help...]

[Recommendation: If the power budget is too low for continuous operation, shut off the transponder completely during the "crisis" rather than operate intermittantly (which is nearly useless and continues to use some power...]

Hope this info helps...I'm concentrating on DAYLIGHT passes now!

In addition, few mobile radios have more than a high/medium/low power setting,
and limited S-meters (LED bar graph). I doubt that the operating rule of
being no louder than the beacon could be observed in practice.

I heard them too, but they are probably from MIR. They seemed to align pretty closely with MIR's AOS/LOS last night (9 Feb).

BTW, right at the end of the 10pm (PST) pass I thought I heard a voice breaking in over the packet. I couldn't tell if it was coming from above, but it seemed to have an accent, and it was off frequency (doppler?) enough I couldn't copy it. Discovery had already set (unless the Keps are off), so my guess is MIR.

Charles, thanks for your compulsive optimism, but when the training director of SAREX posts just a couple of days ago that the SAREX package is not on STS-63, I am forced to believe that it isn't there. Over the past few days, the shuttle has been within a couple of degrees of the Mir. And the cosmonauts have made much effort to keep their packet station going even through the rendezvous. I have a crude setup, a broadband stick feeding an AOR AR-2500 scanner, decoded by a Universal M1200. Still, a couple of days ago, I received a clear packet from R0MIR acknowledging packet contact with a couple of midwestern stations. In the past few weeks, most Mir overhead passes have included some packet signals. Before the flight, it was reported that some of the shuttle crew had just received their amateur calls and may be making contact from the shuttle using HT's with the portable stick-on window SAREX antenna.
Bye... Ted..

Gary, The transponders on AO-13 are not full because the majority of the VHF stations are FM mobile and FM base stations, without the antennas required for satellite access. With a satellite having a high power transponder that can be heard by these rigs, the dual band mobiles and base stations would be able to overload and fill up the transponder if they are not discouraged from doing so. I don't believe that there can be any "limited" FM operation because of this.

346. GPS Newbie has application, needs solution

Newsgroup: rec.radio.amateur.space
Date: 1995-02-10 23:58:05 UTC
From: Dale.Reed@ab.com
Message-ID: <3hguid$sms@news1.cle.ab.com>
Source record: 25735
Cross-posted to: sci.geo.satellite-nav,rec.radio.amateur.space

Folks,

I have just received the packet from USCG on GPS and have some other information, but I haven't found a simple solution to my problem yet. Haven't checked out any magazines or such yet, so I probably deserve to be flamed, but....

What I want to do is have a PC with a board in it that gets the time (only, don't need location/nav info) from GPS and sets the clock in the PC, which then exports the time to the network. I know with the proper location info, fancy board, etc., that I could have the PC clock accurate to ~100 ns. But all I need to do is keep the usual PC clock and set it once per while to the nearest second or so, just so the computers on my LAN show the same time. I WANT TO LOW-BALL THIS ON COST.

Any hints?

I know I could use WWV/WWVH/WWVB/CHU/etc., but I'd like something that
A.) doesn't depend on HF propagation
B.) can set the clock quickly after booting
C.) I can do as a hobbyist with a curiosity about GPS.

Thanx in advance for any info! Please reply by E-mail to Dale.Reed@ab.com

Regards,
Dale Reed WD8MLN
Allen-Bradley Co. Automation Group
Highland Heights, Ohio

This post represents my own personal stuff and not Company stuff. And yes, I know we are part of Rockwell, but I'm looking for hobbyist info!

348. Two-Line Orbital Element Sets (TLE549)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-11 03:53:48 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.792474828@eel>
Source record: 25740

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

349. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-02-11 03:55:36 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.792474936@eel>
Source record: 25741

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

HI all:
I have a couple of newbie questions, I want to try some of the
satelites that have HF uplinks and downlinks, what are the satelites, and
what are the frequencies?
-73- De Greg, N8PPZ/ag

>If I remember my chemistry:
>
>Air is mostly Nitrogen, Atomic Wt = 7, Molecular Wt = 14 (N2)
> (use 14.4 for the 20% Oxygen=8)

No. The atomic number of nitrogen is 7, the atomic weight of the most common isotope is 14. The atomic number of oxygen is 8, and the atomic weight of the most common isotope is 16. Use 28.8 for the atomic mass of the atmosphere.

>Hydrogen Atomic Wt = 1 Molecule is H2, molecular weight = 2

No. The atomic *number* of hydrogen is 1. The atomic weight can be 1, 2, or 3 depending on which isotope of hydrogen is involved. The most common isotope has an atomic weight of 1.

>
>Helium Atomic Wt = 2 Molecule is He (inert gas) mol wt = 2 also

No. Helium consists of 2 protons, so the atomic number is 2, and also 2 neutrons, so the atomic weight is 4. (There is also He3 which is an isotope of helium containing 2 protons and only one neutron, but it's not found in any abundance on Earth.)

Yep,

I agree and must recant. I realized last night how foolish I was before after hearing the cosmonaut's last night. After looking at my sat tracking program, I saw that MIR was about 3-5 minutes behind the shuttle. So it must be MIR's packet I heard.

Thanks for the correction.

Charles

357. Re: Anyone notice INTERMITTANT RS-15?

Newsgroup: rec.radio.amateur.space
Date: 1995-02-12 19:32:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <8A362F0.14E60000E0.uuout@freddy.supernet.ab.ca>
Source record: 25757

Just a note of observation....RS-15 seems to be overloaded and shutting down when over the lower part of north america....probably the power drain on the bird is too much....I also noticed that the problem goes away when the bird gets north of about 35 to 40 degrees north lat. and heads off toward europe.

Well, my best guess is too may users with too much power. Try keeping power down to a minimum level to sustain contact (not 5-9 signals).

Best of luck guys.

>Thanks.

Since the schedule is changing soon, I'll post it here.

The Mode Schedule from December 19 to February 20 will be:

Mode-B : MA 0 to MA 100
Mode-BS : MA 100 to MA 130
Mode-S : MA 130 to MA 132 <- S beacon only; B trsp. is OFF
Mode-S : MA 132 to MA 155 <- S transponder; B trsp. is OFF
Mode-S : MA 155 to MA 160 <- S beacon only; B trsp. is OFF
Mode-BS : MA 160 to MA 180
Mode-B : MA 180 to MA 256
Omnis : MA 230 to MA 25
Alon/Alat 180/0 Move to attitude 230/0, Feb 20

Please be sure to check the schedule before transmitting on mode B.
Many don't, and end up interfering with mode S. If the B transponder
is not
received, DON'T TRANSMIT MODE B!
Note: The 145.812 beacon is active during mode S transponder!

The wisp string is:
000Omni025B100BS130S Bcn132S155S Bcn160BS180B230Omni256
Wisp now takes this entry in "Edit Satellite Data" in "Database".

The next schedule will probably be:

QST *** AO-13 TRANSPONDER SCHEDULE *** 1995 Feb 20 - May 22
Mode-B : MA 0 to MA 190 | *** P R O V I S I O N A L
Mode-BS : MA 190 to MA 218 |
Mode-S : MA 218 to MA 220 |<- S beacon only
Mode-S : MA 220 to MA 230 |<- S transponder; B trsp. is OFF
Mode-B : MA 230 to MA 256 | Alon/Alat 230/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, May 22

It is also available at ftp.amsat.org as well as on the AO-13
beacon on 145.812.

The RS-15 passband is indeed divided up into sections for the AGC. I am surprised that it took this long for there to be overpowering signals that compress one or more of the passbands. There is not a lot of output power on this satellite, and many will keep using more and more power to try to get heard.

It happens on AO-13 a lot. If you get a chance, you might listen for the offending station and gently remind them that this is not HF, and more power doesn't make up for an insufficient antenna.

I repeat, there was no SAREX aboard STS-63. The SAREX team did, however, attempt a test (on the last day of the flight) of the Shuttle/Mir VHF radio using ham frequencies. Since two of the crewmembers had done SAREX before and a third had his license, we had no shortage of amateurs onboard. We've concluded from the test that the radio will work marginally, but we probably will not use it with a window antenna on STS-71 (there will be payload bay antenna).

For each of these MIR rendezvous flights we will use Config M (voice only). Obviously, it will be voice only, since we will be in close proximity to MIR and its packet station.

363. Graduate Research Opportunity with SEDSAT 1 project at UAH

Newsgroup: rec.radio.amateur.space
Date: 1995-02-12 23:24:38 UTC
From: chrisl@gamma1.LPL.Arizona.EDU
Message-ID: <3hm5bm$4t9@news.CCIT.Arizona.EDU>
Source record: 25763

[Reposted by chrisl@lpl.arizona.edu for Dennis Wingo]

From: wingod@CSPARC.UAH.EDU

This is a notice that there is an opportunity for a graduate
student to come to UAH for their graduate engineering degree
and get to work at NASA and on the SEDSAT 1 satellite.

What We Need

We need someone in software engineering, Power systems or EE discipline
and or a Mechanical/Aerospace Engineer.

What is offered

This is through the Alabama Space Grant Consortium and it involves
a stipend of $16,000 dollars per year plus $4000 for tuition and travel.

What it Takes

We want the best out there. We have a very cool project that is flying
on STS85 in the Summer of 1997. If you have good grades and a very
strong desire to make an impact on student space flight projects
we want you.

When it Starts

This position would begin in fall term (August 1995) and is has the
potential to run up to three years. There will be one year of
work out at NASA for your own benefit under the program. Actually
you would work full time here at UAH on the satellite and at the
Marshall Space Flight Center.

What Part of the satellite we need help with

We need someone to take over the imaging experiment and bring it to
its successful conclusion. We also very much need people to write
software for the imaging experiment. Mechanical design and testing
is also needed for the satellite.

When do you need to respond?

NOW. The deadline is March 1 1995. We have to get approvals from
NASA MSFC for support as well as approvals from the University before
it is submitted so hurry!!

Is this a sure thing?

No. This is a proposal that is going to the Alabama Space Grant Consortium and you will be in competition with students from all over the state of Alabama as well as students at the other four campuses of the University of Alabama System.

BUT. We have an excellent chance of winning and we will do everything possible to help.

So please contact us now!

From: bob@texas.net
Message-ID: <3hmt95$bue@empire.texas.net>
Source record: 25764

I'd like to hear from anyone out there who's using the AEA ST-1
satellite interface or the Trakbox. I'm putting my first satellite
station together using the Icom 275/475 twins, a DSP-2232, an SSB
UEK2000, and a Yaesu G-5400B rotator. I'd like to discuss some
details on how the interfaces work, especially if the CT-16 satellite
interface is used (can the CT-16 and ST-1 co-control the rig, will
running mode S with a transverter into the 275 pose a problem, etc?)

Tnx

Source record: 25765

```
Observed 50.61 deg NLat, 7.55 deg ELon; FEB 12, 1995

Following the satellite-name you read the approx.
hour (local=sun-time) and motion-direction of the
pass (N=northbound, S=southbound).
This time +/-1.5h is valid for the next 10+ days
to expect the satellite to be visible in range of
northern-hemisphere-stations, add 11h and switch
S<->N for another pass to observe.

NOAA-9 11:S APT 137.62 MHz On
NOAA-10 17:N APT 137.50 MHz On
NOAA-12 19:N APT 137.50 MHz On
NOAA-14 13:N APT 137.62 MHz On
Meteor 3-5 12:N APT 137.85 MHz On

Not active: Meteor 2-21 and OKEAN 1-7. Leo Wikholm
from Finland told me that he was able to copy APT
of OKEAN 1-7 from passes over northern Russia from
time to time (below my horizon).
Did not check for NOAA-11 (AVHRR is dead).
At my latitude when NOAA-9 is setting NOAA-14 is just
rising, both birds are just 1 deg above horizon
causing some minor interference, but no problem
(NOAA-9 rev. #52418 and 52419). Excellent images
from NOAA-14.

: be *possible* through P3D without adversely impacting its power budget.
: I don't want to leave the impression that I think a lot of such operations
: would be desirable on other counts.

I'd agree that there are times when AO-10 and 13 aren't used much.

However, if all goes to plan so that you can stick up a fixed
set of antennas (no $500 rotator) and get good signals without
buying bricks and mast mounted preamps (another couple more
C-notes), the satellite will have a lot more activity.

While I've commented that basic physics makes it tough to have
FM transponders in high earth orbit, a bigger problem is keeping
hogging the satellite by running high power/big antennas.
Whether or not little stations with have fun with the satellite
depends a lot on the notching device. As it is now, people often
need amplifiers because other people are running amplifiers...

How primitive do you want it to be?

You can receive radio noise from Jupiter on the HF bands.
Or you can copy Sun noise on most of the VHF/UHF bands.
If you want to be able to hear hydrogen emissions at the
water hole frequency, that'll be a little tougher. If
you want to map quasi-stellar sources, that's ambitious.
Define what you want to do, and we'll see if we can
help.

Gary

>)the usual PC clock and set it once per while to the nearest second or so, just
>)so the computers on my LAN show the same time. I WANT TO LOW-BALL THIS ON COST.

I just finished development of both software and hardware for this.
The company I work for will be able to sell the complete kit to You,
but it will not be cheap. It will handle both DOS and Windows PC's,
and updates entire Novell or WFWG/NT networks. The product is intended
for use with our fleet-management software, where timing is important
both for the statistics collected, and for timing the pre-assigned
time slots. The fleet-management software is based on GPS and
Inmarsat-C for communication.

If You have some specific questions I might be able to answer them.

I've used the DSP-1232 to do 1200 bps PACSATs a few times. We never used
the automative tuning though, just manually kept the bargraph lined up.
There are some special sat programs for the AEA DSP on w3eax.umd.edu
in /pub/aea-dsp.

375. data over MIR audio link

Newsgroup: rec.radio.amateur.space
Date: 1995-02-17 09:55:35 UTC
From: mario@wguser.wg.estec.esa.nl
Message-ID: <3i1rqn$akc@wgserv.wg.estec.esa.nl>
Source record: 25776

I'm responsible for an experiment to be flown on the EuroMIR '95 mission (later this year) and considering to up-/download data to my onboard equipment using a secondary voice loop the Russian can make available for the experiment.
The data link I need should be 9600 baud so that in the (average) 10 min. visibility of MIR I can transfer up to 256 KBytes data. My first idea was to use a commercial modem and adapt it (2-wires to 4-wires) to the headset/mike audio interface.
The voice link I can get is full duplex (2 separate simultaneous channels) with no push-to-talk, 300Hz to 3.5 KHz bandwidth, 1200 ohms impedance (both input and output) and (I think) FM modulated on UHF.
Can anybody suggest me any hardware that I could use for that? I'm looking for an half-size PC board (ISA bus) and some comms protocol I can interface to the (MS-DOS based) onboard software.
(of course it should also be hacker-proof to avoid people messing around with delicate instruments but I promise to give you some hints to receive something really interesting from onboard MIR).

379. Re: Mir Tracking troubles

Newsgroup: rec.radio.amateur.space
Date: 1995-02-18 22:09:12 UTC
From: drted@ix.netcom.com
Message-ID: <3i5r68$ap1@ixnews3.ix.netcom.com>
Source record: 25778

The important question is "How recent are your keps?" At 400 kilometers, Mir is still affected by atmospheric drag. Every few months they fire boosters and reestablish their design altitude. An important part of the all too irregular supply flights is the fuel needed to do this. Of course, when this is done, your keps become useless. My last keps were from 10 feb 95 and last night, I believe I heard packet while my tracking program showed them overhead. Someday, I will install something better than a broadband whip to catch satellites with. FTP to archive.afit.af.mil in pub/space to get keps that are updated daily. Bye... Ted.. <drted@ix.netcom.com>

>(both input and output) and (I think) FM modulated on UHF.

At 3.5 kHz, it won't work for 9600 bps, which uses 4.8 kHz in its
standard form. A normal modem can be used, however, with a modification
to remove the telephone 2-wire interface. You will probably need
matching transformers to get the impedances close. 9600 modems are
getting rather cheap, and they can set their speed to whatever your link
can handle. You can use standard software to transfer files, such as
Z-Modem.

One possible problem is Doppler Shift on the link. This can cause a
little static for voice, but can completey destroy a data link that needs
and uses the full bandwidth. You may need to set your bit rate in the
modem down to 2400 or even 1200 bps. Experimentation will tell!

383. Is AO-27 Still Online in FM Mode?

Newsgroup: rec.radio.amateur.space
Date: 1995-02-20 04:15:03 UTC
From: leigh@rain.org
Message-ID: <3i9507$o5i@news.rain.org>
Source record: 25782

Today and yesterday, (February 18th and 19th), I attempted to monitor AO-27 in the FM mode on 436 mHz, but heard nothing. Yes, I listened during daylight hours on a weekend.

BTW, I used two different sets of keps, with a tracking program that works for the RS-birds, but heard nothing for several different scheduled passes of AO-27.

Was AO-27 shut off in the FM repeater mode over Southern California this weekend, or am I doing something wrong?

Thanks. --Leigh/KM6JE in Santa Barbara.

Does anyone out there have any information in regards to starting up a packet radio system...the requirements for licensing...equipment requirements, etc?

I don't really know anything about computers and ham radio. Even if you could point me to more information--that would be helpful.

I appreciate the help.

KEVIN

387. 1691 down converter ?

Newsgroup: rec.radio.amateur.space
Date: 1995-02-21 09:09:56 UTC
From: rrook@sefl
Message-ID: <3ical4$7dm@sefl.satelnet.org>
Source record: 25785

I just acquired a 1691mhz downconverter and preamp. They are made by Microwave Modules Ltd, the preamp has the model number mmg 1691, the converter has no model number. I unfortunately was not able to get the manual for either unit. Does anyone have an address for this company or have manuals they would be willing to copy for me? It is easy to figure out how to hook up the antenna but the power plug has several pins and I am not sure of the hook up. Tnx and 73.

I, for one am hoping that Yaesu will replace the FT-736R with something a little more modern. Although I like my 736R, a newer design would probably be set up with a data port that could handle 9600 baud, and *maybe* an AFC based upon the discriminator output that could be used for doppler correction in FM mode.

I also don't think that the memory function is as intuitive as on Yaesu's newer radios.

Oh yeah, a little pet peave. Why would an $1800 radio not come standard with CTCSS encoding when every cheap 2m ht now includes this feature? Surely, even a dedicated satellite freak (such as I :-) *might* occasionally want to talk to other Earthlings!

My two cents worth.

Howdy, all!

There's 100 kHz of bandwidth available on FO-20 Mode JA. I've worked the satellite (once), but I had temporary Yagis at the time. I'm back to my normal omni antennas. Has anybody had success with FO-20 (CW, SSB, or both) with omni antennas? I'm using a preamp on the 70cm downlink, of course.

I am looking for phone numbers and email addresses for people at Weber State who worked on the Webersat. If anybody has this info, it would be much appriciated if you mailed it to me.

Of particular interest is the ground station and operations aspect of Webersat.

Thanx

Message:
Has anyone used the TM-255A yet? I'm particulary interested in if
would work well in satellite operations. The built in 1200/9600 baud
packet port seems a plus. I have yet to see one "up close and
personal" or read a fact sheet on it. Does it do CW? Are there
provisions for keying external devices? Does it have an adjustable
low power setting? Any input and/or opinions welcome. Thanks.

Hello,

I am working for a rotor interface running on a 80C535 system. The language used is C. There are only standard-4-byte floats available.

Until now i have routines to calculate sat and moon. they are accurate for slow flying objects (moon, ao-13 eg) but not for fast flying (uosat, noaa).

has ony // sri. has anyone routines to caclulate sat positions from keplerian dats using standard floats?

thansk a lot

(keying errors not corrected, i am not used to work with VI editor)

There is a wall chart in a nearby conference room labeled
"United States Frequency Allocations -- The Radio Spectrum"
It shows usage from 3 kHz to 300 GHz. It's apparently put
out by the U.S. Department of Commerce.

At the bottom left, in small print, is this notice:
"For sale by the Superintendent of Documents, U.S. Government
Printing Office, Washington, D.C. 20402"
and at the bottom right it says:
"U.S. Government Printing Office 1994--366-677"

403. Two-Line Orbital Element Sets (TLE555)

Newsgroup: rec.radio.amateur.space
Date: 1995-02-28 01:37:41 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.793935461@eel>
Source record: 25802

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Hello to who ever may read this. As most of you know we are 58 weeks from the launch of the new
Phase 3-D Sat. That should make this October meeting in Orlando Fl. One of the best .

What I need from everyone is help finding prizes to give away. These are the door prizes and such for the national meeting. I would like names and addresses for people to contact.Preferably
someone that is some what familar with AMSAT. But this need not be the case.

I will then follow up with a mailing to them of our organization. This will be on Official staionary
also It will be better laid out and spelled properly as I will use a word proccessor to do this stuff.

I will not pass on the names of the people who send me this info. unless they give me spicific permission
to do so.

Yes I have a list of the suppliers and such from QST CQ 73 mag's also Ham radio Trader and several publications that are involved.

I want to know and work with the main person at these places and also be able to get the clubs
all over the net involved.

Last yr I was the talkin station as some of you may remember. I met many great people from all over the world
lots of XE calls some G's and some D's this sat is international and is being built for all just as the net is.

Trust me when I say I don't get paid for this. It probably cost me tons of money each yr. Why do any of us do this. It is just a small way to give back to everyone that has helped us over the years.

Please help me get in touch with many of the people who can help with the prizes. and any of the local clubs would be
appreciated too.

73 for Now and if any one needs help getting on the birds let me know I will try to find some one in your area to help
or a book of we willdo it on here.

email me drayegon@america.com AD4RR@amsat.org

It sounds to me like the problem described is very similar
to the situation that exists when trying to send data over
celphones. You might consider using some of the newer
modems designed to provide *reliable* data comms over
cellular links. Contact the major cellular carriers for
details.

Up *and* down? For what specific frequency range? For what purpose? L
band is pretty big, and there are a lot of ways to go, so we will need
more specific information.

Spacenet 2's position is 69 degrees west. I would think you could ask at a local satellite tv retailer or possibly at a television station in your area if a bird at 69 W is visible from your area.

Good luck! Patrick Wiggins, Hansen Planetarium, SLC, UT USA

As it happens I stumbled across a site last night with .z files. Reading through one of the README files it said that one has the option of downloading the file compressed by using the whole name including the .z or one can drop the .z and that gets the uncompressed version sent. You might want to try dropping the .z.

Good luck, Patrick Wiggins, Hansen Planetarium

>73 de Henning, Montreal

It depends on the satellite. For the Space Shuttle or the Russian
space station Mir, you want to update daily since they modify their
orbits often, especially the shuttle. For synchronous satellites I think
very seldom. I receive the NOAA low level picture transmitters for
weather pictures and I update about once per month. So it depends on
the satellite and how accurate you need to be. For the NOAA sats about
once per month seems adaquate. I think the lower the orbit the more
often you might want to update.

422. Re: NASA Select TV

Newsgroup: rec.radio.amateur.space
Date: 1995-03-03 05:33:42 UTC
From: manfred@isi5.ssl.berkeley.edu
Message-ID: <3j69nm$j0h@agate.berkeley.edu>
Source record: 25664

According to a quick calculation with SatTrack (V3.1),
SPACENET 2 is about 4.4 degrees above the horizon in London.
So, depending on where in the UK you are located you might just be
lucky from that point of view. However, remember that the antennas
on Spacenet 2 might not cover the entire footprint of the satellite.
You may need a rather large dish to get enough SNR on the downlink.

Good luck and 73,
Manfred --- W6/DL5KR

428. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-03-03 20:32:38 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.794262758@eel>
Source record: 25674

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

429. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-03-03 20:33:29 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.794262809@eel>
Source record: 25675

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

433. AO-13 Mode J?

Newsgroup: rec.radio.amateur.space
Date: 1995-03-04 17:10:22 UTC
From: ky1tluck@aol.com
Message-ID: <3ja6tu$30o@newsbf02.news.aol.com>
Source record: 25678

As someone who has been off of AO-13 for well over a year, I was surprised to discover, upon my return, that Mode J seems to have gone away.

What was the main reason for that happening?

You need 'gzip' to decompress, use archie to find!

Well, I consider the great state of Washington to be excellent DX
from my QTH here in Maryland. I would be interested in a schedule with
KG7WC and other Western US hams active on RS-15. We need to use CW
because of my inability to get a decent SSB signal through the link.

If you haven't tried RS-15, you might want to. I have had good CW
success with 100 watts to a vertical (uplink) and a simple dipole
downlink antenna. I want to try portable operation this summer, and
can be available in DE/WV/VA/PA for those trying (like me) to get
satellite WAS.

snare@realjet.win-uk.net writes:
>Question: Does anyone know if it is possible to receive NASA
>Select transmissions from the Spacenet 2 satellite or a
>relayed transmission here in the UK?

No it isn't available in UK, even though it's probably high enough to be above your horizon.

Having a geosynch satellite above your horizon is just one requrement for being able to receive the signal.

Most importantly the Spacenet 2 signal is concentrated towards the 48 contigious United States. It also spills over into lower Canada, much of Mexico and the Caribiean.

Even though Spacenet 2 is clearly above the horizon if you're located in Brazil you cannot receive its signal there because you're too far outside its footprint.

Other requirements include the correct band LNA, correct recevier, an NTSC TV set, etc.

As far as a relayed transmission is concerned - sure you can receive it! Provided that somebody is retransmitting it, and that it isn't encoded.

But why would it be transmitted to Europe? NASA's charter does not include informing Europeans about the status of its programs. Still, for some reasons some European party (e.g. ESA, ASI, the Russian Space Agency, etc.) could request that the signal be relayed to Europe for some particular reason (European astronaut or payload onboard, etc.) in which case you may be able to find the signal on any of the transatlantic satellites.

In the case of the STS-63 mission much of it was transmitted over Atlantic satellites to be eventually received by the Russian mission control center in Kaliningrad.

So call your Parliment representatives and demand that they carry a full time NASA Select channel in the United Kingdom!.

The on board hardware suffered a failure, so only B and S are now
running. The satellites' orbit has changed some as well, and apogee is
near the Equator. This puts the sun behind the satellite for months at a
time, and the pointing angle is set way off to keep the batteries
charged. It is 230/0 right now and until May.

442. HELP: STS-67 W5RR Packet

Newsgroup: rec.radio.amateur.space
Date: 1995-03-05 11:31:59 UTC
From: Doug Freeman <dougfree@onramp.net>
Message-ID: <3jc7ff$dui@news.onramp.net>
Source record: 25690

I am new to packet radio and for what ever reason my ability to figure
out the manual for the MFJ-1278B controller is getting me nowhere.
So far I have been doing ok on normal packet connections but I have
some questions about the Shuttle. I am using 145.55UP and 144.49dn
frequences.

My questions are

How do I setup for automatic operation?
Do I use beacon mode and what text?
Should I turn Digipeat Off?

In general besides the controller set up what are the proper
procedures? I did receive their packet dn information last night
so I would really like to see if my new antenna and only 50w can
make it up.

Thanks for you help,
Doug Freeman

John:
I found a Display4 file you were asking about in your 2 Mar 1995 posting.
The location that archie came up with (and only one, by the way), was
mrcnext.cso.uiuc.edu (128.174.201.12) under the full file name of
FontsDisplay4.cpt.Hqx dated 6 Jun 1991 and 290,168 bytes.
Hope this helps you. 73, Duane KJ7HO.

: I'm following STS-67 with a tracking program and I got two element
: sets from this group, the two sets give different orbits, my question
: is how can I tell which of the two elements is the right one (i.e.

There is always the possibility that both orbits are correct.
That's to say that between the issuance of the two sets of TLEs the
actual orbits changed (that happened a bunch during the last flight).
Part of my job here at Hansen is keeping the local public and media
informed of when the shuttle might be visible. In order to make sure
I've got my data right I run each set of TLEs through two different
tracking programs.
Then, just to be sure, I then check the shuttle's position, as seen
on NASA Select, against what my read outs are showing.
So, while it may be difficult to get access to NASA TV, there are
gobs of shareware / freeware tracking programs out there so you might
want to get a second program and compare outputs.

Clear skies!

>--
>Roland Cowan WF4P/AAT6MC
>ac579@rgfn.epcc.edu

I would be happy to inform you of the frequencies. They are as follows:

VOICE 144.910 144.930 144.950 144.970 144.990
PACKET 144.490

I case you need the downlink it is 145.550

As a matter of fact, at 0642 Z 06 MAR 95, I worked WA4SIR, Ron Parise who
is an astonaut aboard the shuttle Endeavour on phone. Good luck!!

>Mike McCarthy

Mostly the shuttle is using packet at a frequency of 145.550 as the downlink. The shuttle is on phone (voice), but it is rare. You can receive the packet bursts and send them to a TNC such as the PK232 and look at the data on a pc. At this time the shuttle's footprint is only over the southern parts of California and it flies by (when I get out to work it) from about 9 P.M. on until about 1 A.M. with about 1 1/2 to 1 3/4 hours between passes.

There is a 'phone Bulletin Board at 303-497-5042. The service is free,
but you do have to register when you first call.

I haven't found exatly the same info on Internet, but there is a
companion set of data, plus a lot of other neat stuff, available at

gopher.sel.noaa.gov

If you have a Web browser (eg. Mosaic or Netscape) you might want to try:

http://www.sel.bldrdoc.gov/

Good luck,

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

460. Tracking on old computers

Newsgroup: rec.radio.amateur.space
Date: 1995-03-07 00:03:29 UTC
From: Gary_Rogers@DGC.ceo.dg.COM
Message-ID: <9503070003.BN00037@rtp41.rtp.dg.com>
Source record: 25584

Message:
About a week ago I posted a request for suggestions of tracking
software to use on an old 8088 PC. The response was great! Thanks to
all who took the time to offer their help. By far the winner was
InstantTrack, available from AMSAT. Coming in at second place was
Traksat, versions 2.7 and 2.8. These are older versions that will
support reduced graphics. Also mentioned were: Orbits II for CGA
and Orbits III for EGA/VGA. I also received one vote for QuickTrak.
It turns out I had an older copy of Traksat 2.7 laying around and
it does the job fine. One again, thanks to all.

Howdy!
So as to keep anyone else from sending me email about my last
post, perhaps I'll just say that I'm still waiting (hoping) to hear from
the original poster. :-)
What I have is an FTP address which *may* have the TLEs but until
I hear back from the poster who started me on this quest, I don't know
which of the TLEs are for the satellites in question.
Taking a slightly different tact on this, if there is anyone out
there who knows the catalogue number for the "flight(s)" of three
satellites which travel in the shape of a triangle you might want to post
that here and maybe then someone will be able to finally figure out what
so many of us seem to want to know.

Clear skies!

Sunspots have interesting effects on amateur radio. One of the most
famous concepts is that of the MUF, or Maximum Usable Frequency, that
is varied based on solar activity. You can find out about this, and other
effects of the sun on atmosphere and radio waves in the many publised
amateur radio books. The ARRL (Amateur Radio Relay League) publishes
a yearly book called the Handbook, that has very good explinations of
this stuff. Look for a copy in your library!

Good luck.

PS -
Just this weekend, my cable company started getting bad picures from
their satellite feed. This is a fimilar problem aound here, linked with
the sunspots. (or so they tell me!)

469. Freeware DOVE telemetry deocder windows program

Newsgroup: rec.radio.amateur.space
Date: 1995-03-07 04:27:01 UTC
From: forsberg@crash.cts.com
Message-ID: <D51z12.Cp2@crash.cts.com>
Source record: 25708

I have uploaded a program I wrote that will decode the telemetry that comes from the DOVE (DO-17) satellite. It runs with windows 3.1. It is freeware and can be downloaded via ftp at ftp.amsat.org in the directory amsat/software/windows/telemetry. All you need to receive telemetry data is a 2M radio and a normal packet TNC. If you don't have access to Internet then you can sent me $1 and I will provide postage, mailer and disk (please specify) to anywhere in USA or Canada. The file name is dovedv12.zip.

>mc8431@mclink.it

If you would like to work the shuttle on packet or phone (voice) the
frequencies are as follows:

PACKET UPLINK 144.490
DOWN 145.550

PHONE UPLINK 144.491 144.493 144.495 144.497 144.499
DOWN 145.550

Good luck! I worked Ron, WA4SIR Sunday night March 5th.

The TLEs for the NOSS (Naval Ocean Surveillance System), aka "White Cloud" satellites are in kilroy.jpl.nasa.gov/pub/space/elements/molczan and mirror sites. The two clusters of the second generation NOSS 2 system are brighter, and are what people usually see by accident.

Does anyone have QSL infofor STS67? I haven't been able to find the
press kit or info on QSL and have looked in the usual places.
Thanx!

Bruce I too was looking for the Instant Track program. I looked on ftp.amsat.com in the Instant Track dir but did not find the program. Could you tell me the location and the file name. Just a question, Is there an update to the ver 1.00, and if so is it Shareware or freeware.

477. BEST ALL MODE 2 MTR. RIG?

Newsgroup: rec.radio.amateur.space
Date: 1995-03-07 16:33:32 UTC
From: dir00@amail.amdahl.com
Message-ID: <dir00.22.055F4F8C@amail.amdahl.com>
Source record: 25569

I thought I would ask here which all-mode rig, in your opinion, would be "the one to buy" as you use SSB/CW for the sats. I am looking at the new Kenwood TM-255A, and also looked at the ICOM 275H.

I know the Icom is 100 Watts, but it is also twice the price, being that you can buy the Kenwood for about $869 now and they give you a $70 rebate from Kenwood. I wanted to stay away from the dual band sat. rigs like the 790/820H/970/736 because I am not sure I want to spend $2000+ yet. I have a TS-700 SP, and can listen to AO-13, etc. (and work RS-10/15), but thought I would wait for phase 3D to see what the final uplink/downlink phases will be.

Anyway, the TM-255A is supposed to have very good inter-mod supression as it is 144-148 ONLY. I guess I am looking for people who have experiance with equipment I should/should not be buying. I think it should be posted here, rather than direct to me, as I think a lot of people are in the same position I am in...and it is a topic other than "where are the latest elements"!!

Thanks, and 73, Dave

P.S. HURRY, rebate ENDS 3/20/95!!! :-) :-)

SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX) BULLETIN
JANUARY/FEBRUARY 1995

For More Information Contact:
American Radio Relay League (ARRL)
Educational Activities Department (EAD)
225 Main Street
Newington CT 06111-1494 USA
Telephone (203) 666-1541

FREQUENTLY ASKED QUESTIONS ABOUT SAREX-

WHAT IS SAREX?

With the help of Amateur Radio clubs and ham radio operators, astronauts have been speaking over the ham airwaves while in orbit. They are talking directly with large groups of the general public, showing teachers, students, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning. The program is called SAREX, the Shuttle Amateur Radio EXperiment.

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible numbers of people, particularly youngsters, in technology and the US space program with the help of Amateur Radio.

During a SAREX mission, the astronauts will typically make the following types of Amateur Radio contacts:
Scheduled radio contacts with schools.
Random contacts with the Amateur Radio community.
Personal contacts with the astronauts' families.

A handful of schools are selected from around the world to make contact with the shuttle during most SAREX missions. These contacts are prearranged, giving the schools a greater chance at making a successful contact. Two or more students at each of the selected schools ask questions of the astronauts during the contact. The nature of these contacts embodies the primary goal of SAREX--to excite students' interest in learning.

WHO SPONSORS SAREX?

The American Radio Relay League (ARRL), The Radio Amateur Satellite Corporation (AMSAT) and NASA sponsor these exciting experiments. AMSAT volunteers support all technical operations for SAREX, and mentor participating school groups. The ARRL provides the Amateur Radio community with SAREX information and educational support. The ARRL Educational Activities Department (EAD) and NASA Headquarters create and distribute SAREX lesson materials and resources for teachers. SAREX is supported by the Federal Communications Commission (FCC).

Hundreds of Amateur Radio operators work behind the scenes, including those from NASA's Amateur Radio clubs at the Johnson Space Center, Marshall Space Flight Center and Goddard Space Flight Center.

A SAREX Working Group was created to administer the program. The working group is comprised of Roy Neal, K6DUE -Chairman; Rosalie White, WA1STO -ARRL; Frank Bauer, KA3HDO -AMSAT; and Lou McFadin, W5DID -NASA Johnson Space Center.

I AM A SCHOOL TEACHER--HOW CAN I GET STARTED?

Schools wanting to make a scheduled SAREX contact with the astronauts are required to submit proposals and a SAREX school application to ARRL.

While only a handful of schools get chosen for scheduled contacts, all schools can participate by eavesdropping, or by trying to make a random contact with the shuttle astronauts. SAREX lesson materials are available from ARRL for all schools who participate. Imagine listening in on the astronauts from your classroom! If you are a school teacher, but you are unfamiliar with ham radio, you can still become a part of SAREX in your school. Contact the ARRL EAD to get a list of your local Amateur Radio clubs to assist you.

If you are a parent, grandparent and/or a ham radio operator, contact ARRL EAD and a local school. EAD will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis. This is a tremendous opportunity for you to showcase SAREX and Amateur Radio to kids of all ages in a big way.

HOW DO I SUBMIT A SAREX SCHOOL APPLICATION FOR A SCHEDULED CONTACT?

If your school is interested in a radio contact for a future SAREX mission, you must complete a SAREX school application and write an educational proposal. ARRL collects applications and proposals, and then forward them to the SAREX Working Group who makes the final selection in collaboration with the astronauts. All grade levels and type of schools (rural, suburban and particularly urban) are encouraged to apply.

SAREX school applications are available by sending a business-sized self-addressed stamped envelope to ARRL, or email your request for an electronic version of the application to ead@arrl.org. Applications may be returned to ARRL by mail or email.

A proposal must accompany all completed applications. The SAREX Working Group and NASA want to know-
1) How will you:
a) integrate this activity into the school curriculum and

b) involve as many students as you can, participating through essay contests, poster drawing, letter writing, etc.
2) What are your capabilities for setting up all necessary Amateur Radio equipment and antennas? Do you have the resources of an experienced group of hams to assist you?
3) How will you get as much media coverage as possible?

HOW WILL I KNOW IF MY SCHOOL HAS BEEN SELECTED TO PARTICIPATE?

Schools that have been selected for scheduled SAREX contacts are contacted by a SAREX coordinator. NASA requires school selections to be made approximately seven months prior to launch. If a school is not chosen for the next SAREX mission, its application is recycled for future opportunities. Schools typically wait one year or longer to be selected.

I AM A HAM. HOW CAN I INTRODUCE SAREX TO MY SON OR DAUGHTER'S SCHOOL?

Establish a SAREX station at the school. Bring in a shortwave receiver and let students eavesdrop on amateur retransmissions of the NASA shuttle-to-mission control audio--from launch to landing. Then, set up a 2-meter satellite ground station and attempt a random SAREX contact from the classroom. The teacher may even apply for a school contact, almost guaranteeing that the students will have an opportunity to communicate with the shuttle crew during a future SAREX mission.

ARE THERE VIDEOS AVAILABLE ON SAREX?

The ARRL Educational Activities Department has videos available for school teachers to borrow. Use of the Audiovisual Library is free, the only cost being return shipping.

"Ham Radio In Space" is a 30-minute color video chronicling the participation of schools and hams in SAREX. You and your class will enjoy watching students talk to the astronauts via ham radio as they participate in this unique educational program. To borrow a copy of this video, mail a postcard with your request to ARRL EAD. Borrowers, please indicate the date you will need the video. Requests should be made at least one month in advance.

CAN A HAM MAKE AN UNSCHEDULED SAREX CONTACT?

Yes. The astronauts have not lost sight of why SAREX has been so successful. It is the Amateur Radio community that has brought the astronaut's voices into classrooms all around the world. During most SAREX missions, many of the crewmembers will make random contacts with earth-bound hams. They make these contacts during their breaks, before and after meal time, and during their pre-sleep time. In fact, over the past years the astronauts have contacted thousands of amateurs around the world. On many missions, they have even carried a 2-meter packet radio station. Innovative computer software allows the crew to operate the packet gear in an "unattended" mode, allowing amateurs to make contacts with the ROBOT station when the astronauts are working or sleeping.

WHAT TYPE OF EQUIPMENT DO I NEED?

A typical SAREX ground station includes a 2-meter FM transceiver and 25-100 watts of output power. A circularly polarized crossed-Yagi antenna capable of being pointed in both azimuth (N-S-E-W) and elevation (degrees above the horizon) is desirable, but successful contacts have even been made with verticals and groundplane antennas. Commercial and public domain computer tracking software is available to assist you in determining when the shuttle will be within range of your station and where to point your antenna. For more information on assembling your own satellite/SAREX station, obtain a copy of the "Satellite Experimenter's Handbook" from ARRL.

HOW DO I "TALK" TO THE ASTRONAUTS?

You may communicate with the shuttle astronauts using a variety of modes: voice, packet (computer) radio or television. It all depends on which equipment configuration the astronauts take into space. For example, astronauts Jay Apt and Mamoru Mohri made hundreds of random voice contacts with Amateur Radio operators during STS-47 in September 1992. When the astronauts were sleeping, however, a robot computer ham station aboard the orbiting Shuttle automatically made contact with hundreds more amateurs around the world. The robot computer transmitted an acknowledgment to each ham whose computer successfully made contact with it.

On other missions, the SAREX configuration has even included Amateur Radio Slow Scan Television (SSTV) and Fast Scan Television (FSTV) allowing amateurs a firsthand glimpse at life in space.

WHAT ARE THE SAREX RADIO FREQUENCIES?

The following VHF frequencies are used for SAREX missions. These frequencies were chosen after much deliberation to minimize contention between SAREX operations and other 2-meter users. If you have any comments, please direct them to AMSAT via Frank Bauer, KA3HDO (at his address in the "Radio Amateur Callbook") or the ARRL EAD. We appreciate the cooperation of all amateurs in making the SAREX operations successful.

Most SAREX operations are split-frequency (the crew uses separate receive and transmit frequencies). PLEASE do not transmit on the shuttle's DOWNLINK frequency. The DOWNLINK is your receiving frequency. The UPLINK is your transmitting frequency. For all operations, Earth stations should listen to the downlink frequency and transmit on the uplink frequency only when the shuttle is in range and the astronauts are on the air.

FM Voice Downlink: (Worldwide) 145.55 MHz
FM Voice Uplink: 144.91, 144.93, 144.95, 144.97, and 144.99 MHz
FM Voice Uplink: (Europe only) 144.70, 144.75, and 144.80 MHz
FM Packet Downlink: 145.55 MHz
FM Packet Uplink: 144.49 MHz

ARE ALL OF THE CONTACTS MADE BY THE ASTRONAUTS RANDOM?

During each SAREX mission, the astronauts' primary work schedules dictate when they can and cannot operate the radio equipment. As a result, most of the general contacts they make are random. If the astronauts are operating their radio, however, you can be certain that many hams will be attempting to contact

them.

WHAT ARE MY CHANCES OF MAKING A RANDOM SAREX CONTACT WITH THE CREW?

The extremely busy work schedules of the astronauts may sometimes reduce your chance for an unscheduled, random contact with the Shuttle. The SAREX Working Group recognizes the long-standing commitment of the Amateur Radio community in supporting SAREX activities and attempts to schedule as many opportunities as possible for general ham contacts during flights. Keep posted to Amateur Radio news sources during a SAREX mission for possible announcements of scheduled general QSO opportunities.

WHEN ARE THE NEXT SAREX SHUTTLE MISSIONS?

The next flights for SAREX are listed below. School applications are no longer being accepted for these missions. Schools who have been selected will be contacted by a SAREX coordinator. If your school was not chosen this time, applications are recycled and you may be chosen for a future flight. Contact ARRL EAD if your application information should change.

Upcoming SAREX Missions (updated 2/1/95):

The following dates are tentative. Please understand that delays in spacecraft launches are somewhat common particularly because there are people on-board!

Mission Date Inclination Crew/Title/Amateur Call Sign
Vehicle Time Altitude
*Notes Mission length Configuration
------- -------------- ------------- ----------------------------

STS-63 February 2, 1995 51.6 degrees James D. Wetherbee, CDR
Discovery 0550:44 UTC 195 miles Eileen M. Collins, PLT
8 days Config. M Bernard A. Harris, Jr., PL-CDR
C. Michael Foale, MS, KB5UAC
TENTATIVE Vladimir G. Titov, MS
RANDOM CONTACTS ONLY Janice Voss Ford, MS, KC5BTK

STS-67 March 2, 1995 28.45 degrees Stephen S. Oswald, CDR, KB5YSR
Endeavour 0637 UTC 218 miles William G. Gregory, PLT, KC5MGA
16 days Config. C Tamara E. Jernigan, PL-CDR, KC5MGF
John M. Grunsfeld, MS
Wendy B. Lawrence, MS, KC5KII
Ronald A. Parise, PS, WA4SIR
Samuel T. Durrance, PS, N3TQA

STS-71 May 24, 1995 51.6 degrees Robert L. Gibson, CDR
Atlantis 195 miles Charles J. Precourt, PLT, KB5YSQ
10 days Config. B Ellen S. Baker, MS, KB5SIX
Gregory J. Harbaugh, MS
Bonnie J. Dunbar, MS
Anatoly Yakovlevich Solovyev, MS
Nikolai Mikhailovich Budarin, MS

STS-70 June 22, 1995 28.45 degrees Terrence T. "Tom" Henricks, CDR
Discovery 184 miles Kevin R. Kregel, PLT
8 days Config. C Nancy Jane Sherlock, MS
Donald A. Thomas, MS, KC5FVF
Mary Ellen Weber, MS

STS-74 October 26, 1995 51.6 degrees Kenneth D. Cameron, CDR, KB5AWP
Atlantis 195 miles James Donald Halsell, Jr., PLT
6 days Jerry L. Ross, MS, N5SCW
William S. McArthur, Jr., MS, KC5ACR
Chris A. Hadfield, MS

Abbreviations: Commander=CDR
Pilot=PLT
Payload Commander=PL-CDR
Mission Specialist=MS
Payload Specialist=PS

Configuration A: FM Voice (attended)
Packet (attended/unattended)
SSTV (attended/unattended)
Configuration B: FM Voice
Configuration C: FM Voice, Packet
Configuration D: FM Voice, Packet, SSTV, FSTV
Configuration E: FM Voice, Packet, SSTV, FSTV (different hardware)
Configuration M: FM Voice, using shuttle/MIR radio

HOW CAN I USE MY SHORTWAVE RADIO TO EAVESDROP ON THE ASTRONAUTS?

When a shuttle mission carries the SAREX payload, SAREX news and astronaut retransmissions are carried by the Goddard Amateur Radio Club's station, WA3NAN, (Greenbelt, MD). This station, and several VHF and UHF repeater groups, will retransmit the audio signals from the shuttle on most amateur bands so that you and the students can hear the communications. You will hear NASA mission commentary, frequent bulletins to advise listeners of astronaut-planned transmissions, and amateur two-way voice and amateur television transmissions with the shuttle. WA3NAN operates on the high frequency (HF) bands at 3.86, 7.185, 14.295, 21.395, and 28.65 MHz and on VHF at 147.45 MHz (FM).

CAN I RETRANSMIT COMMUNICATIONS BETWEEN THE SPACE SHUTTLE AND MISSION CONTROL ON AMATEUR FREQUENCIES?

The FCC rules indicate that amateur stations are permitted to retransmit Space Shuttle air-to-ground communications, provided that approval has been obtained from NASA (FCC Rules, Part 97.113 (e)).

In 1990, ARRL sought permission from NASA, on behalf of radio amateurs, to retransmit shuttle communications. The response from NASA's Office of Public Affairs encouraged such retransmissions, and indicated that the audio is public domain.

If you plan to rebroadcast NASA Shuttle audio, please follow these guidelines:

1) In keeping with good amateur practice and the FCC rules, shuttle audio retransmissions should be limited to missions of a specific educational purpose (non-commercial), such as those carrying the SAREX payload.

2) Retransmissions should be done manually (with a control operator present).

3) Occasionally, NASA audio may contain music. Amateurs should avoid, if at all possible, retransmitting music or any other prohibited transmissions not permitted by the FCC rules (FCC Rules, Part 97.113).

HOW MAY I TRACK THE SHUTTLE WITH A COMPUTER?

A number of software packages are available for tracking the Shuttle on a personal computer. Here are just a few options (ARRL in no way warrants these products):

AMSAT Tracking Programs.
These easy to use programs are perfect for the serious Amateur Radio space enthusiast or beginner. Call AMSAT (The Radio Amateur Satellite Corporation) for current prices and details (301) 589-6062 or write to AMSAT, PO Box 27, Washington DC 20044.

STSPLUS (Shareware for IBM).
This software was designed by David Ransom Jr. The program allows the user to track an orbiting space shuttle or satellite. Excellent graphics and maps help to create a mock Mission Control Center. Look for STSPLUS and other tracking software posted on NASA Spacelink, bulletin board system (205) 895-0028.

OrbiTrack (MacIntosh).
Available from BEK Developers, PO Box 47114, St. Petersburg, FL 33743-7114. Includes a user's manual.

SatTrack (MacIntosh).
Available from Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

OrbiTrack and SatTrack are also available via FTP from sumex.stanford.edu. Look in info-mac/app for the programs sat-trak-102.hqx and orbitrack-214.hqx.

WHAT ARE KEPLERIAN ELEMENTS?

Satellite-tracking computer software use Keplerian elements (also known as "orbital" or "tracking" elements or "Keps") to pinpoint the location of a satellite (or shuttle) at any given time. The Keplerian elements provide the software with a snapshot of a satellite's orbital track, which the computer uses to calculate the future whereabouts of the satellite. Using such a computer tracking program allows an observer to determine when a satellite is to appear above his or her horizon.

Finding Keplerian Elements for the Space Shuttle:

During shuttle missions carrying SAREX, Keplerian elements for tracking the shuttles are available from numerous sources:

AMSAT SAREX bulletins, which include daily Keplerian element postings, are forwarded by W1AW (frequencies listed on the last page) on packet radio, Keplerian teleprinter bulletin schedules, and posted to the ARRL telephone

Bulletin Board System, (203) 666-0578.

The Goddard Amateur Radio Club, WA3NAN, maintains a Bulletin Board System (BBS) which is accessible via the Internet, modem and packet radio. The BBS carries Keplerian orbital elements updated daily, and daily SAREX bulletins and Space Shuttle mission information.
via Internet: wa3nan.gsfc.nasa.gov or 128.183.105.17
via telephone modem: (301) 286-4137
via packet radio: WA3NAN on 145.090 MHz in the DC area.

NASA maintains an electronic information system for educators called Spacelink. Spacelink carries SAREX information, current shuttle mission status reports and Keplerian elements.
via telephone modem: (205) 895-0028
via Internet: spacelink.msfc.nasa.gov or 128.158.13.250
Current shuttle mission tracking elements may be found in the following directory:
Spacelink.Hot.Topics/Current.Shuttle.Mission/Keplerian.Elements.

The Johnson Space Center Amateur Radio Club maintains a BBS with the latest element sets available during a shuttle flight.
via telephone modem: (713) 244-5625.

The most current orbital elements for SAREX and other Amateur Radio satellites are carried on the Celestial BBS.
via telephone modem: (205) 409-9280
Keplerian elements are updated daily, when possible. Documentation and tracking software are also available on this system.

The following are prelaunch Keplerian elements for STS-63:

STS-63

NASA EDUCATIONAL RESOURCES

How do you find information on Shuttle schedules, payloads, space science and mission lesson plans? To make the most of your SAREX experience, NASA has a number of materials and resources available to educators:

Teacher Resource Center Network
Teacher Resource Centers (TRC) contain a wealth of information for educators: publications, reference books, slides, audio cassettes, videocassettes, telelecture programs, computer programs, lesson plans and activities. For more information, contact the TRC nearest you.

Teacher Resource Centers

NASA Ames Research Center, Moffett Field CA

NASA Spacelink

NASA Spacelink is a computer information service that allows individuals to receive news about current NASA programs, activities, and other space-related information, including historical and astronaut data, lesson plans, classroom activities, and even entire publications. Although primarily intended as a resource for teachers, anyone with a personal computer and a modem can access the network.

Spacelink's telephone modem line is (205) 895-0028. Users need a computer, modem, communications software, and a long-distance telephone line to access Spacelink (the data word format is 8 bits, no parity, and 1 stop bit). Your software must emulate a VT-100 terminal.

The TCP/IP address is 192.149.89.61. The new system fully supports the following Internet services:
World Wide Web http://spacelink.msfc.nasa.gov
Gopher spacelink.msfc.nasa.gov
Anonymous FTP spacelink.msfc.nasa.gov
Telnet spacelink.msfc.nasa.gov

For more information, contact the Spacelink Administrator, NASA Marshall Space Flight Center, Mail Code CA21, Marshall Space Flight Center, AL 35812. For help with technical problems call the Spacelink Hot Line (205)961-1225.

NASA Television

NASA Television offers the general public a front-row seat at mission launches and activities taking place in space during a mission, as well as informational and educational programming, historical documentaries, and updates on the latest developments in aeronautics and space science. NASA TV occasionally airs live coverage of SAREX activities. Programming is received by satellite dish or may be available through your local cable television network:

TUNING-IN NASA TV
Satellite--Spacenet 2
Transponder--5
Channel--9
C Band
69 degrees west longitude
Frequency 3880.0 MHz
Horizontal polarization
Audio on 6.8 MHz

For more information, contact: Technology and Evaluation Branch, Education Division, Code FET, NASA Headquarters, Washington D.C. 20546, or call (202) 358-

1540.

HOW DO I OBTAIN A SAREX QSL CARD?

QSL cards are similar to postcards. Hams exchange QSL cards to confirm their radio contacts with other stations.

Participating in the Shuttle Amateur Radio EXperiment can be an exhilarating experience. But, as many hams know, waiting for that coveted QSL card requires a lot of patience. Designing a card for the ultimate DXpedition can be a lengthy process. Here's a behind-the- scenes glance at producing a SAREX QSL, and some tips to help you get your card.

After a SAREX mission, ARRL and the SAREX Working Group work with the crew members to select photos from that mission, and design and layout the QSL card. This may take a few months because of the busy schedule of the astronauts, among other things. Once the card is designed and printed, ARRL forwards the QSL cards to whichever Amateur Radio club is involved with the awesome task of managing the cards.

In the past, amateurs sent their contact and listener reports directly to the managing club. Now, all reports should be sent to ARRL Headquarters.

In order for the managing process to run smoothly, please include the following information in your QSL or report: Shuttle flight number (STS-XX), date, time in UTC, frequency and mode (FM voice, packet, sstv or fstv). This documents the contact or listener report. In addition, you must also include an SASE using a large, business-sized envelope if you wish to receive a card. No cards are distributed without the proper postage affixed or sufficient IRCs included.

The following clubs have graciously volunteered their service for handling QSL cards for the following missions:
STS-67 Edison Radio Amateurs Association, Michigan
STS-64 Nashua Area Radio Club, New Hampshire
STS-65 Lake County Amateur Radio Club, Indiana
STS-59 Orange Park Amateur Radio Club, Florida
STS-60 Cowley County Amateur Radio Club, Kansas
STS-58 Connecticut DX Association, Connecticut
STS-57 Miami County Amateur Radio Club, Ohio
STS-55 IBM Amateur Radio Club/1993, Florida
STS-56 Vienna Wireless Society, Virginia

Getting Started In Amateur Radio:

"You're Invited...Getting Started in Amateur Radio"--free information booklet. Provided as a service of the ARRL, this booklet includes information on your local Amateur Radio clubs, instructors and examination sites and popular study guides. Call our toll-free hotline for new hams: 1-800-32-NEW HAM (800-326-3942). Why not get started, today!

"Now You're Talking!" book (second edition) contains everything you need to know to pass your first Amateur Radio written exams. (ARRL order #3525 $19)

ARRL Technician Class Video Course. Learn the "ropes" with the "pros." You won't find a better course or a better deal anywhere. 5 hours of excitement. Call 1-800-326-3942 for details.

ARRL Books:

"The Satellite Experimenter's Handbook" has the information you need to communicate through, or receive signals from, a growing "fleet" of orbiting satellites and spacecraft--including the Shuttle! Whether your interest is in Amateur Radio, weather, TV-broadcast or other spacecraft, you'll find an immense store of valuable data--everything from setting up ground station equipment to antennas. (ARRL order #3185 $20)

"Your Packet Companion" is perfect for the packet (computer) radio newcomer, covers everything--from assembling a station to sending mail, from packet satellites and spacecraft to the latest networking systems. Its straightforward writing style and clear drawings will get you on the cutting edge of digital ham radio in no time. (ARRL order #3959 $8)

SHUTTLE ENDEAVOUR ASTRONAUTS TO SPEAK WITH STUDENTS VIA AMATEUR RADIO.

With the help of Amateur Radio clubs and ham radio operators, astronauts have been speaking over the ham airwaves while in orbit, as part of the Shuttle Amateur Radio EXperiment (SAREX). During mission STS-67, the crew will be talking directly with large groups of the general public, showing teachers, students, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning. Amateur Radio has been flying aboard the shuttles since 1983.

WHEN: Launch is scheduled for March 2, 1995 at 1:37 AM EST (0637 UTC) from the Kennedy Space Center, Cape Canaveral, Florida. Landing is scheduled for March 18, 1995 at 3:09 PM EST (2009 UTC) at the Kennedy Space Center, Florida. 15 day mission.

WHERE: The launch will place the shuttle into Earth orbit at an altitude of 218 miles and an inclination of 28.45 degrees.

WHY: NASA's intent in making astronauts available for SAREX operations is to involve the largest possible numbers of people, particularly youngsters, in technology and the US space program with the help of Amateur Radio.

During SAREX missions, the astronauts will typically make the following types of Amateur Radio contacts:
Scheduled radio contacts with schools.
Random radio contacts with the Amateur Radio community.
Personal contacts with the astronauts' families.

AMATEUR RADIO-LICENSED CREW MEMBERS:
Stephen S. Oswald, Commander, call sign KB5YSR
William G. Gregory, Pilot, call sign KC5MGA
Tamara E. Jernigan, Payload Commander, call sign KC5MGF

Wendy B. Lawrence, Mission Specialist, call sign KC5KII
Ronald A. Parise, Payload Specialist, call sign WA4SIR
Samuel T. Durrance, Payload Specialist, call sign N3TQA

PAYLOAD: Primary Payload--ASTRO-2. ASTRO-2 is the second in a series of ASTRO missions that will make precise measurements of astronomical objects such as planets, stars, and galaxies, in relatively small fields of view. Consisting of a variety of instruments, the payload will provide stability for extended periods and highly accurate instrument pointing of 1.2 arc seconds. The ASTRO observatory is a key element in the Spacelab program. (Information provided by the NASA Public Affairs Library Staff.)

SAREX SPONSORS: The Shuttle Amateur Radio EXperiment (SAREX) is sponsored by the American Radio Relay League (ARRL), The Radio Amateur Satellite Corporation (AMSAT) and The National Aeronautics and Space Administration (NASA). SAREX is supported by the Federal Communications Commission (FCC).

PARTICIPATING SCHOOLS: A handful of schools are selected from around the world to make contact with the shuttle during most SAREX missions. These contacts are prearranged, giving the schools a greater chance at making a successful contact. Two or more students at each of the selected schools ask questions of the astronauts during the contact. The nature of these contacts embodies the primary goal of SAREX--to excite students' interest in learning.

ADDITIONAL INFORMATION FOR AMATEUR RADIO OPERATORS-

SAREX RADIO FREQUENCIES: During most SAREX missions, many of the crewmembers will make random contacts with earth-bound hams. They make these contacts during their breaks, before and after meal time, and during their pre-sleep time. In fact, over the past years the astronauts have contacted thousands of amateurs around the world. On many missions, they have even carried a 2-meter packet radio station. Innovative computer software allows the crew to operate the packet gear in an "unattended" mode, allowing amateurs to make contacts with the

ROBOT station when the astronauts are working or sleeping.

The crew will use separate receive and transmit frequencies. PLEASE do not transmit on the shuttle's DOWNLINK frequency. The DOWNLINK is your receiving frequency. The UPLINK is your transmitting frequency.

FM Voice Downlink: (Worldwide) 145.55 MHz
FM Voice Uplink: 144.91, 144.93, 144.95, 144.97, and 144.99 MHz
FM Voice Uplink: (Europe only) 144.70, 144.75, and 144.80 MHz
FM Packet Downlink: 145.55 MHz
FM Packet Uplink: 144.49 MHz

CALL SIGNS:
FM voice call signs KB5YSR, KC5MGA, KC5MGF, KC5KII, WA4SIR, and N3TQA
FM packet call sign W5RRR-1

QSL VIA: Send reports and QSLs to ARRL EAD, STS-67 QSL, 225 Main Street, Newington, CT 06111, USA. Include the following information in your QSL or report: STS-67, date, time in UTC, frequency and mode (FM voice or packet). In addition, you must also include a SASE using a large, business-sized envelope if you wish to receive a card. The Edison Radio Amateurs Association in Detroit/Edison MI has generously volunteered to manage the cards for this mission.

SHUTTLE TRACKING: Current Keplerian elements to track the shuttle are available from the NASA Spacelink computer information system, BBS (205) 895-0028 or via Internet spacelink.msfc.nasa.gov, and the ARRL BBS (203) 666-0578. Also, the JSC ARC BBS will have the latest element sets available during the STS-67 flight. The number is (713) 244-5625, 9600 baud or less.

The following are prelaunch Keplerian elements for STS-67:

STS-67
1 00067U 95061.32643015 .00011689 00000-0 86071-4 0 46

CONFIGURATION: During STS-67, the SAREX hardware will be carried in configuration C. SAREX configuration C consists of the handheld transceiver, I/F module, PGSC, spare battery set, window antenna, packet module, SAREX headset

assembly, personal recorder, and the required cable assemblies. The packet module contains a power supply and packet TNC. The power supply provides power for the TNC and the handheld transceiver. The TNC interconnects with a radio transceiver so that data to and from the computer is transmitted to and received from other amateur radio stations. Configuration C is capable of operating in either the voice or data mode in communications with amateur stations within LOS of the Orbiter. This configuration can be operated in the attended mode for voice communication and either the attended or automatic mode for data communications. The payload control weights is 45 lb (20.41 kg).

No. The fuzzy satellite downlink problem has nothing to do with
sunspots. What's causing the bad pictures is the alignment of the
satellite receiving antenna with the sun. A couple of times a year,
the sun's position in the sky coincides with the satellites' position.
The sun is a *very* big source of radio noise, and it drowns out the
satellite's transmission for a while until it is no longer directly
behind the satellite.

In my oppinion the Icom IC-275 is a better receiver. I currently own a 255 and a ic275a. The receiver on the 255 is great but it lacks the

notch and pbt filters that work great to remove qrn. Both radios are great, but the icom has more features.

486. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-03-08 03:57:23 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.794635043@eel>
Source record: 25599

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I use InstantTrack on my IBM XT. A perfect job for the XT. It runs quite fast for all the work the 8088 must perform. I also have the 8087 co-processor which I am sure helps to speed things up as the 8088 doesn't have to do the math too!

A beam works best. I listened with a vertical, but a beam really pulled in
the signal. The shuttle's orbit is taking it over the lower southern portions
of the U.S.. You might naot be able to hear it depending where you are in USA.

: PS -
: Just this weekend, my cable company started getting bad picures from
: their satellite feed. This is a fimilar problem aound here, linked with
: the sunspots. (or so they tell me!)

Actually it has nothing at all to do with sunSPOTS, just the sun. A few
times a year for a couple of minutes the sun happens to be directly behind
the satellite of interest. The sun itself is a prodigious source of RF on
many freq bands, including C and Ku. The sun temporarily becomes the
dominant source of RF in your dish's beamwidth, causing SNR to fall and
possibly drop below the threshold of detection. It happened to the Winston
Cup Race at Richmond last sunday - I was there, but I wanted to record it,
too :-(

Thanks for the reply, and I will save them all and post a summary of what you all have said.

I have no doubt that the Icom has a better receiver...and some features I would like. I would like a real S meter, and computer control. However, the A model of the 275 is not available any more and the H model is $1550-$1600. The TM-255A can be had (after the rebates, etc) for about $780.

What is the primary use of AMSAT.ORG. Are there files stored there
general use. Is it the same host as FTP.AMSAT.ORG? Is there a gopher
somewhere that points to these so those of us who don,t have
uncontrolled TELNET and FTP may be able to search them out and use
them? I have had no luch with VERONICA searches.

Thanks

The Commonwealth Edison Employee Amateur Radio Society (CEEARS) repeater on 145.35 Mhz here in Chicago area has been taking a real beating because of the shuttle communications. During a mission, the repeater is in a 100% duty cycle and is putting out somewhere around 250 watts. I have been told that the club has been going through
final amp tubes (at a cost of $500 per set) at a fairly high rate and that the tech committee has decided to cut back temporarily. I have been told that a new transmitter is in the works. I have no idea when it will be on and where exactly.

I'll keep everyone posted when I find out more details. Please bear with our club.

TrakBox_Turbo version installation info.
==

Dallas semiconductor released 80C32 code compatible high speed CPU
DS80C320. This chip has upper compatible with Intel 8032/8052 series
CPU and three times faster with the same crystal. There are many other
additional functoins (two serial ports, watchdog timer, many interrupt
sources, high X-tal clock etc..), and now, TrakBox can work with this
CPU. The calclation speedup is 4 times faster than ordinary T_B.

You need (1) DS80C320 CPU, (2) 22.118400MHz X-tal (3) 320TRK EPROM

[Install]

1.At first, you must certificate your TrakBox is working with original
EPROM and CPU. (8031,32,51,52 CMOS or NMOS).

2.Off the battery back up jumper (JP13)

3.Replace the original CPU with DS80C320.
Check the T_B is running with new CPU. The speed up 1.5 or 2 times
faster than the original.

4.Replace the EPROM with Turbo EPROM (320_xxx.ROM).
Check the T_B can run with COM port baud rate 4800.

5.replace the original X-tal(11.0592MHz) with 22.1184MHz.

6.Now, Your TrakBox_Turbo is completed.

[Notice]

1) New CPU with 22Mhz clock rate needs high access time EPROM
and RAM. In my case, I used 120ns EPROM (Mitsubishi M5M27C512K-12)
and 80ns RAM (62256LP-8). If your T_B doesn't run, you may replace
with high speed EPROM(-12 means 120nSec access time).

Many beta tester reported that turbo code run with fast EPROM
and RAM from many supplyer.

2) Dallas Semiconductor released preliminaly DS80C320 chip and
the early lot has bugs in micro code. The present version
has xxxxA6-yyy on the lavel. If you have xxxxA3-yyy version, this

chip is not usable for TrakBox Turbo.

[Dallas Semiconductor info.]

Source record: 25594

In article <3jl5ol$rl6@freenet3.scri.fsu.edu>, bmm1@freenet3.scri.fsu.edu (Bruce M. Marshall) says:
>
>... the Nov/Dec Amsat journal stated that VK2JJM in Australia has
>done some work with the DSP-12. Does anyone know how to get in touch
>with him.

His 1993 VK callbook address is "Rivermead", Bostobrick, NSW 2453 Australia.
This indicates he is at a property named Rivermead, near a town called
Bostobrick in the state of New South Wales, post code 2453.
He "might" be accessible via packet radio, but unless you find someone
else in that area and can ask for a suitable BBS address, the snail
mail address might well be the best.

I'm not on the packet racket so I can't offer direct help, but e-mail
me if you think I could help find him. Willing to make enquiries.

Cheers.

>I got the shuttle freq (145.55 FM) from a posting on this service. What
>type of antenna is necessary for reception of the signal?

Would you believe a handheld with a rubber-duckie?

HONEST!

(of course I didn't say that it would be a good signal).

The quality of the signal you receive from the shuttle depends on many factors, including the shuttle's attitude, which window the antenna is in (it can either be in the commander or pilot's window - the ones furthest to the sides for the front windows).

On your side it depends on what's in the way between you and the shuttle, how directional your antenna is, your antenna's gain, whether or not you have a pre-amp, etc.

Under the *best* of circumstances the shuttle can be *clearly* heard on a handheld. During the STS-58 mission I heard Bill McArthur KC5ACR many times on my handheld inside a brick building in a high QRM room (computers and other electronic equipment all generating RFI).

On the current shuttle mission though the shuttle's attitude is changing quite often to support the astronomical observations, so some of the time the antenna will be facing towards deep space - with the entire body of the shuttle blocking its signal. Not even a moonbounce antenna can get though then!

Good luck though, and give it a try - no matter what equipment you're using.

507. Callsigns for WiSP

Newsgroup: rec.radio.amateur.space
Date: 1995-03-10 17:25:20 UTC
From: little@pecan.enet.dec.com
Message-ID: <3jq220$pb9@jac.zko.dec.com>
Source record: 25606

I'm sure this information is lurking somewhere just waiting for me to find it, but I cannot seem to determine what the callsigns are that WiSP wants for each satellite. It wants a Broadcast Callsign and a BBS Callsign, yet I haven't hit the combination that allows me to download any messages or get a directory fill.

Could someone post the two callsigns for each of the digital satellites?

>I am in...and it is a topic other than "where are the latest elements"!!

The IC-275A/H is a shockingly better radio than any of it's competitors.
Paired with a IC-475A/H, I think they're the hottest setup currently
available. However, they are a lot of money. IMHO, the TS-790A is death
on toast for satellite work, and the IC820H isn't much better. The IC970
is pretty nice, but oh so expensive. The FT736R is a solid workhorse,
but the design is getting a little long in the tooth. If you can live
without a bunch of bells and whistles, it'll still get the job done
in a cost effective manner. (I'm expecting an updated radio from Yaesu
in the near future. The 736 really looks dated compared to some of the
whiz bang offerings. But with the dollar/yen ratio being what it is,
I'm not sure any of us will be able to afford it.)

The sad truth is that the TS-700SP is about the best Kenwood has
ever done in a VHF all mode. Put a good mast mount preamp in front
of it, and it'll still serve about as well as Kenwood's newer offerings,
better than some. Kenwood has never really figured out how to make
a good VHF/UHF radio.

A vertical will do for all except direct overhead passes. A turnstile
will work for that, but won't work as well when the Shuttle is near
the horizon. A Lindenblad will work better over the entire pass, and
an eggbeater style may do Ok too. Of course auto-tracking beams work
best, but aren't really necessary for the Shuttle or MIR. If you've
already got a gain vertical, just try that. Whatever you use, minimize
feedline loss and mount a mast mount preamp at the antenna if you can.

512. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-03-10 19:57:47 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.794865467@eel>
Source record: 25514

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Sat Callsign

AO-16(PACSAT) 145.90,.92,.94,.96 FM 437.0513 SSB 1200 Baud PSK

LO-19(LUSAT) 145.84,.86,.88,.90 FM 437.1258 SSB 1200 Baud PSK

UO-22(UOSAT5) 145.9, .975 FM 435.12 FM 9600 Baud PSK

KO-23(HL01) 145.85, .90 FM 435.175 FM 9600 Baud PSK

KO-25(HL02) 145.98, .87 FM 436.5 FM 9600 Baud PSK

The digital sats use a program suite containing
PB/PG/PFHADD/PHS or WISP. The broadcast callsign (in PB.CFG) is the
satellite's callsign with an SSID of -11. The BBS callsign
(in PG.CFG) is the satellite's callsign with an SSID of -12.

514. RE: Any mods for Icom IC-275H/IC-475H

Newsgroup: rec.radio.amateur.space
Date: 1995-03-11 01:59:16 UTC
From: jho@xilinx.COM
Message-ID: <199503110159.AA04512@clemenza.xilinx.com>
Source record: 25512

John,

I thought about the same thing as you are thinking - to mod my IC970A
after I bought it about 2 years ago. I couldn't find any info about it.
I even asked a Japanese friend of mine to find out info from ICOM Japan.
The answer I got was that all of the ICOM all mode V/UHF rigs are equiped
w/ high sensitivity (SSB/CW) receivers. Build-in band pass filters(covering
ham bands only) are utilized to avoid intermod in the receivers.
Therefore, wideband receive can not be achieved in this type of rigs.

As you know, all the HF SSB rigs are also equiped
with 8-10 passband filters to cover ~ 30MHz frequency span. I think that
the same principle applies here too - to avoid intermod of the high sensitivity
receivers.

The ICOM R7000/9000 use 10-20(?) bandpass filters to achieve wideband(~2GHz)
converage.

By the way, besides 2/475H, you probably wouldn't find the mod-files for Yaesu 736R,
IC970, and KWND TS790A either.

I heard from ICOM Japan, the upper/lower limits of the frequencies
of the IC970 are hard coded in ROM. This might be true for your 2/475H.

Finally, I gave up in finding the mod-file for my ICOM 970A and bought a
scanning receiver.

Hope this answers your question. By the way, what sat ant are you using?
I am using a AOP-1 and found the performance so-so.

73,

Jonathan/ab6ls

Subject: Any mods for Icom IC-275H/IC-475H

I've just purchased a Icom IC-475H and IC-275H. I've looked at the local
mods BBS and databases, and can't find anything for these radios. Are
they *that* perfect, or am I just missing them?

- John

Jeff, if you compensate for doppler shift by adjusting your RIT, you may drift into someone elses's QSO. I've made a few contacts on RS-10 in both CW and SSB; I keep a hand on the transmitter VFO and adjust the transmit freq about every 10 or 15 seconds. It takes practice; I ain't too adept at it yet.

73, and maybe I'll catch you on RS-10. --Leigh/KM6JE in Santa Barbara.

Steve:

Try using ftp.qualcomm.com
then select amsat. Dont know why but your problem is common. Hope this
works for you.

519. Re: M2 or KLM 440/2m antennas?

Newsgroup: rec.radio.amateur.space
Date: 1995-03-11 15:29:38 UTC
From: bobr@on-ramp.ior.com
Message-ID: <3jsfl2$sss@on-ramp.ior.com>
Source record: 25519

I have owned the KLM 40CX and 14C for several years. I have found both antennas to perform extremely well. I have not had problems with the switching arrangement (I do use the switches). I have no experience with the M2 antennas but I have heard that they may be constructed a bit better than the KLMs but may not perform quite as well. I understand that the 40CX is probably the BEST uplink antenna available. My signals are consistently above average using this antenna. The cushcraft AOP is not recommended (in my opinion).

John C. Wren (jcw@kd4dts.radio.org) wrote:
: I'm looking at putting up a set of satellite antennas, and am trying to decide
: between the M2 and the KLMs. I've touched and looked at the KLMs, but not
: the M2. The KLM seem to be susceptible to crapping up in the switching box
: arrangement. I know a great many people think highly of the KLMs, think that
: the Crushcraft are junk, and have no opinion about the M2s. Anyone out here
: have any thoughts on the matter?

Voyage Through Solar System CD

Macformat says "Slickly produced multimedia package"
Publishers Weekly "Astounding, often breathtaking videos"
Popular Science "Heavenly Voyage"

Ages 8 to adult. Launches you into escape velocity with the realism of up-close images, full- motion action, and dynamic music. This unique interactive program is the first of its kind, because it utilizes actual video and film from Jet Propulsion Lab and NASA.

Full motion video and animation demonstrate the awe inspiring images and informative text. A Voyage Through the Solar System will answer questions such as: When did our solar system form? What does the surface of Venus look like? How do you pronounce Eistla Regio? Educational as well as entertaining, this program is designed for the whole family. Features: Over 70 action-packed movies with exciting music and narration. True color, high resolution NASA/JPL photos. Detailed information on each member of the Solar System. Printout capabilities.

REQUIRES: IBM PC, 386+, DOS compatible computer, 640x480, 256 color VGA graphics card, monitor. MPC-compatible sound card. 4MB RAM, Windows 3.1+. DOS 3.1

This Hybrid disc includes software for Mac LC2 or better, 256 colors

$*$*$ 20 Weak Signal Challenge (HAM Post) - Now $30 $*$*$

Three weeks have passed since the original posting of this challenge.
During that period, the Web page was accessed over 1000 times.
The weak signal recording has been listen to and processed by
many. Several operators using their best audio filters have been
able to copy my call. And yet, a correct identification of the calling
station has not been made. I am increasing the amount offered to $30
and will continue to escalate the prize until someone cracks the problem.

Details on the challenge can be obtained from my Web page:

http://www.webcom.com/~af9y/

The winner will be announce in the UseNet groups carrying this post
and my Web page.

Final Note for those trying their own signal processing techniques:

Many have asked about the WAV file format used for the
A/D recording. The format is a PC Windows standard which
contains 43, 8 bit-bytes of header (which can be thrown away)
followed by a consecutive series of 8 bit A/D data. The sample
rate was 8192 samples/sec.

Good Luck,
de Mike Cook - AF9Y

Address requests for subscription to lists to ; listserv@amsat.org

To directly send mail to the BB use ; amsat-bb@amsat.org

Hope this helps,
73, N9AVG

>

The general practice is to change the higher of the two frequencies
used. For Mode A (2 meters up/10 meters down) the xmit would be the
one to adjust while listening to your downlink.

Message-ID: <Pine.SUN.3.91.950312190458.20048B-100000@cortex>
Source record: 25532

Hello all,

I have a trial version of WiSP that I downloaded from AMSAT.
I can get it to read the keplerian files from AMSAT (AMSAT.ALL and
NASA.ALL), but it curiously doesn't include STS 67. So I added STS 67
manually and tried to edit the satellite Kep data by hand.

Everything seems fine, but upon returning to the screen for STS 67, the
Epoch time , Mean anomaly, and orbit number have been changed to all 0's.

I have tried entering the epoch time as 95069.250000 and 95 69.250000
but no good.

Just how do you update the epoch time and mean anomaly ? What could I be
doing wrong ? It seems so simple !

Thanks & 73's

Try limiting the decimal places to 4 or 3. I beleive there is a limit
there when manually editing the values. IE 95069.25

You can also add the elements in from a separate file. Just use the
update function as usual, but specify the other file. The keps for the
new satellite will get added in(or updated).

SB NEWS @ AMSAT $SPC0313
* SpaceNews 13-Mar-95 *

BID: $SPC0313

=========
SpaceNews
=========

MONDAY MARCH 13, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* H-II LAUNCH SCHEDULE *
========================
February 24, 1995
NASDA HQ, Tokyo

The H-II Launch Vehicle with the Space Flyer Unit (SFU) and Geostationary Meteorological Satellite-5 (GMS-5) aboard is newly scheduled to be launched as follows:

1. Primary Launch Date: March 15, 1995
2. Launch Window: 16:45 - 18:10 (JST=UTC+9h)
3. Alternative Launch Period: March 16 to 31, 1995

Regarding the malfunction having been detected in SFU, it has been recovered to the normal condition and confirmed there is no concerns with the launch. The relating organizations have agreed to settle the above new launch schedule.

[Info via Yoshiro Yamada]

* WEBERSAT NEWS *

* STS-67 LIFTOFF DATA *
==========
STS-67 lifted off successfully with a first motion time of 02-Mar-95 06:38:13 UTC. STS-67 carries catalog number 23500 and international designation number 1995-007A.

[Info via Ken Ernandes]

* LOGGING OUT OF MIR *
==========
More and more people are trying to use the MIR PMS these days, and that is fine if we all follow some simple rules.

How many times have you seen a whole MIR pass full of <<DM>> messages (DM-Disconnect mode) and no data, and it appears that know one is logged in? Well, in reality, someone is logged in, but may have gone out of range of MIR and is unable to logout of the MIR PMS. This results in the PMS that is tied up until the PMS idle timer expires and forces a disconnect to the out-of-range station. After 8-10 minutes, MIR will try to force out the missing station with ten (10) <<D>> (D-Disconnect request) packets. After the last <<D>> packet, MIR will accept the next connect request heard.

Rule: If you are connected to the MIR PMS, make sure you send the LOGOUT command (B) to MIR 2-minutes before LOS or when Mir gets below 10 degrees above the horizon. This will help prevent ruining a whole pass for the stations down range of your QTH.

Remember, only 1 station can connect to MIR's PMS at a time, ALL others must wait.

[Info via G. Miles Mann, mann@pictel.com, WF1F @ K1UGM.MA]

* SpaceNews NEWS *
==========
Maurizio Bertolino has announced that he is translating issues of SpaceNews into the Italian language and making them available free of charge on his Trance BBS in Italy. The number for the BBS is +39-11-482751.

This raises the number of languages SpaceNews is available in to five (English, French, Portugese, Spanish, and Italian). Thanks to all those who take the time to do the translations every week.

* SpaceNews AVAILABILITY *
==========
SpaceNews is a non-commercial electronic journal of interest to Amateur Radio Operators involved in satellite and other advanced areas of telecommunications. It is published every week (as time permits) and is available for unlimited circulation provided no charges are made and no profits are realized from its availability.

SpaceNews is available from a variety of different electronic sources. It is widely distributed on the Amateur Packet Radio (AMPR) network

through a system of thousands of terrestrial packet bulletin board systems around the world, and follows normal AMSAT message routing. It is also uploaded weekly to the AMSAT-OSCAR-16 digital store-and-forward "Pacsat" satellite.

SpaceNews is carried on the Usenet news service under the newsgroups of rec.radio.info, rec.radio.amateur.space, sci.space.news.

Those with Internet access can obtain the latest issue of SpaceNews by using the Unix "finger" command as follows:

finger magliaco@pilot.njin.net

Those with e-mail capabilities can receive SpaceNews by sending a blank message to infobot@infomania.com with a subject of:

#FINGER magliaco@pilot.njin.net

Archives of past SpaceNews issues are available via anonymous FTP at pilot.njin.net (IP address = 128.6.7.38). Files are located under the /pub/SpaceNews directory. Issues from 1993 and 1994 have been compressed in .ZIP files, while issues from 1995 are available individually in ASCII text form.

Many of the files available via FTP at pilot.njin.net are also available at trustno1.pc.cc.cmu.edu [128.2.41.51]. This system is a 486DX2-66 MHz PC running Linux, and can accept 100 simultaneous FTP sessions. It also carries a great deal of information relating to the television program "The X-Files".

543. Sat tracker for HP100LX??

Newsgroup: rec.radio.amateur.space
Date: 1995-03-14 11:05:36 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.434.006B1FAA@mail.mei.com>
Source record: 25543

I'm looking for satellite tracking software which will
run on an HP100LX palmtop computer (CGA monochrome, plain
vanilla DOS 5.0, no extended or expanded memory).

If it only tracks a single sat, that's OK. Graphic
mercator projection of the Earth's surface with
sat circle of visibility would be nice.

Any FTP sites I can check out? Thanks.

Send your card (and a biz sized SASE) to:

ARRL EAD STS-67 QSL
225 Main Street
Newington, CT 06111

... and don't hold your breath. Still waiting for cards from the last two missions.

(STS-67 SAREX QSO #1590)

Depending on your location, a ground plane on the roof will work just fine. Local folks in the Silicon Gulch area can work the shuttle with j-poles, ground planes, and just about anything else. I'm switching between a discone and an eggbeater.

(the eggbeater is a turnstile variant- it's horizontally polarized at the horizon, going to right hand circular straight overhead- good for the shuttle, and also for weather sats at 137 MHz. The response of ground plane antennas, and especially "gain" antennas such as colinears or j-poles drops off directly overhead.)

The current mission (STS-67) is a 28 degree orbit. That makes it a bit more of a challenge if you're north of Los Angeles. Here, the max elevations I see are about 14 degrees above the horizon. But, still doable.

Also pretty good these days is R0MIR, the Russian space station. They also appear on 145.550 (simplex).

The shuttle packet uplink frequency is 144.490 MHz. This is where you transmit. The shuttle transmits on 145.550. PLEASE do not transmit on 145.550. If you do, many people will call you on the phone. Some will offer to help, some will offer to burn your house down.

You don't need a lot of power to work the shuttle- I worked it using about 35 watts into an eggbeater on the roof.

The shuttle is also doing voice work, also on 145.550.

There are numerous orbit prediction packages available for the Macintosh and even for the pc. These are a great aid at telling you when to listen- on STS-67, we get two or three 8 to 10 minute passes per day.

If you'd like to read more, check out the Satellite Experimenter's Handbook by Davidoff. It's published by the ARRL, and available at most amateur radio stores.

Cheers-

It's not the dish's fault. You're just an an unlucky latitude. Due to
the Earth's tilt, the apparent elevation of the Sun changes during the
year. For many locations, the Sun's path slowly goes from "south" of the
satellite belt to "north" of it and back again. Twice a year, as the two
coincide, there's solar interference to deal with. Apparently, you're
far enough north that the satellite belt is at the same elevation as the
southernmost excursion of the Sun's path. You only get one interference
period each year instead of two, but it lasts a long time.

ADRS announces new WWW and FTP sites
-----------------------------------------

The American Digital Radio Society (ADRS), publisher of the Digital
Journal, is pleased to announce its new WWW and anonymous FTP site
addresses now available for use by its members and others in the
world wide ham radio community. THE ADRS WWW and FTP servers are
at a commercial site with very high capacity connections to the
Internet network so that you should encounter no difficulties or
delays in connecting!

The ADRS Web Pages describe and give information about the ADRS, its
publications and services, and contain what is now probably one of the
most complete set of hyperlinks connections to other amateur radio related
WWW sites and related Internet sites worldwide! You are invited to visit
the ADRS WWW Pages at: http://www.iea.com/~adrs to learn more about
ADRS and as the best starting point for exploring amateur radio on the
Internet! To use the ADRS WWW site, you need will need an access to the
Internet which permits you to use Mosaic, Netscape or a similar Web Browser
which provides HTTP (Hyper Text Transfer Protocol) capability. (The new
Prodigy Internet WWW Web Browser was tested and performs well.)

The ADRS Anonymous FTP server contains software libraries which
mirror much of the software which is available on ADRS' BBS, including
the latest versions of special software available only from ADRS.
Files on the FTP server are downloadable. You are also invited to
visit that site at: ftp.iea.com/public/adrs . An extensive listing of
other amateur radio Anonymous FTP sites with hyperlinks to those other
FTP sites worldwide is also included on the ADRS WWW Pages
at: http://www.iea.com/~adrs . To access the ADRS FTP site, you will need
an Internet access over which you can use an FTP client to transfer files
using FTP (File Transfer Protocol).

: has a wide enough receive area to pick up sun RF more than a few times a year.

Maybe they're telling you that 'cause they have other (possibly heat-related)
problems. In the back of most of the sat TV guide magazines (like Orbit,
OnSat, etc) there's a chart of when what sat will be effected where. I can
get one fromm my father if you'd like, and look your area up.

The other possibility is that they're using a small dish on Ku band which
will result in less gain and a much wider beamwidth.

554. Help with WiSP and LO-19

Newsgroup: rec.radio.amateur.space
Date: 1995-03-15 19:34:26 UTC
From: little@iamu.chi.dec.com
Message-ID: <3k7fg2$fdg@jac.zko.dec.com>
Source record: 25555

OK, now that I think I have the callsigns set up correctly for WiSP, I still cannot successfully talk to LO-19. I am receiving it fine, but I never get acknowledged in its list of stations connected, nor do I get any response when I ask for fills. It is possible something is wrong on my transmit side, but this station used to work under PG/PB. What would be causing LO-19 to ignore me or not hear me?

Station set up is:

Yaesu FT-726R
KLM short crossed yagis for up (14 elements?) and down link (18 elements?)
MFJ-1278 with TAPR PSK modem
Mirage B1016 (although I don't usually use it.)

|>Hi all, can somebody explain me the meaning of the various satellite mode ?
|>For example, Oscar 13, Mode B, Mode L, Mode J, Mode S, ...
|>I thank you in advance.

They determine what bands are used for uplink and downlink frequencies.

Mode	Uplink	Downlink
B	70 cm	2 m
J	2 m	70 cm
L	23 cm	70 cm
S	70 cm	13 cm

Sometimes the mode is suffixed with another letter such a D or A meaning
Digital or Analog, or in some cases combined modes such as JL where
either 2 meters or 23 cm can be used for the uplink and 70 cm is used for
the downlink. This is all supposed to be changing, but I haven't seen the
new mode specifiers.

From: jacksobp@vuse.vanderbilt.edu
Message-ID: <1995Mar16.070314.25035@news.vanderbilt.edu>
Source record: 25560

I was wondering if someone could post (or email) a list of 2 meter frequencies that STS missions utilize when talking to hams on earth. At the same time I am interested in knowing possible frequencies in any band (HF,VHF,etc) that are often used for rebroadcast of STS/mission control communication. I ran across a 2m simplex (rebroadcast, not SAREX) one while in Maryland this summer during the extended duration microgravity mission and would like to be able to listen again! I've recently been told by a former astronaut that ALL mission's are rebroadcasted in many different bands. I know that these frequencies will naturally vary from location to location, but if I have some idea I can search around for them. Hey I'll even enjoy any current info on the SAREX program itself. Thanks very much!

From: tkelso@afit.af.mil (TS Kelso)
Subject: Two-Line Orbital Element Set: Space Shuttle

The most current orbital elements from the NORAD two-line element sets are
carried on the Celestial BBS, (334) 409-9280, and are updated daily (when
possible). Documentation and tracking software are also available on this
system. As a service to the satellite user community, the most current
elements for the current shuttle mission are provided below. The Celestial
BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using
8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation
and software are also available via anonymous ftp from archive.afit.af.mil
(129.92.1.66) in the directory pub/space.

569. Shuttle Freqs and Rebroadcast

Newsgroup: rec.radio.amateur.space
Date: 1995-03-17 04:20:38 UTC
From: Dick Harper <dharper@kumc.wpo.ukans.edu>
Message-ID: <1995Mar16.222038.87969@kuhub.cc.ukans.edu>
Source record: 25420

Since there have been several asking, I thought it might be worth
posting.

Shuttle Frequencies:

SAREX

Downlink, voice and packet 145.55MHz

DO NOT TRANSMIT ON THE DOWNLINK FREQUENCY

voice uplink: 144.91, 144.93, 144.95, 144.97, or 144.99. All voice FM.
Note: The astronauts will not favor any one of the above frequencies.
Therefore, the ability to talk with an astronaut depends on selecting one of
the above frequencies chosen by the astronaut.

Packet uplink: 144.49MHz

The Goddard Space Flight Center amateur radio club planned HF
operating frequencies:
3.860MHz 7.185MHz
14.295 21.395
28.650

This information was received from NASA public relations.

GL de N0USP
Dick

P.S. Mir uses 145.55 for uplink and downlink voice and packet.

570. Re: MIR Packet operating info wanted

Message-ID: <3kb7fr$5ec@indy-backup.indy.net>
Source record: 25419

Kerry,
It's a packet bbs. Since time is limited, most people I've monitored
just send the sysop a message containing their call/qth. Or check
for a qso message addressed to them.

I've never managed to connect, but twice I got DICONNECT packets
addressed to me (if you get one when you're not connected it means
BUSY). There's always a pileup here... :-(

> on with the other 2 passes.

In the Silicon Gulch area (37.317268 N, 120.452778 W) the best elevations we saw were on the order of 14 degrees. I copied packets from STS-67 on about 10 passes, and connected on 3. One of the connect passes was at an elevation of 11 degrees. It just takes a little more work (and a little more luck).

Operating hint: if your TNC supports it, use software carrier detect, and run with the radio squelch open. Your TNC can probably decode packets at or a little below the noise level.

There is a mailing list just for shuttle keps, though it's a little late in this flight to be subscribing. Send a message containing "info elements" to listserv@thomsoft.com and you will get a mail message back about the mailing list. To just subscribe, send a message containing "subscribe elements Your Name" to listserv@thomsoft.com.

I'm in Dallas,TX. I left my packet radio on for three days hoping to
log the shuttle transmitting packet. I picked up MIR many times,
but never logged the shuttle transmitting on 145.550.

Posted-By: auto-faq 3.1.1.2
Archive-name: radio/personal-intro
Revision: 2.1 1994/11/01 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

578. Two-Line Orbital Element Sets (TLE568)

Newsgroup: rec.radio.amateur.space
Date: 1995-03-17 23:07:51 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.795481671@dolphin>
Source record: 25428

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

579. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-03-17 23:09:53 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.795481793@dolphin>
Source record: 25429

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

580. Kep data for 3/17 ??

Newsgroup: rec.radio.amateur.space
Date: 1995-03-17 23:21:28 UTC
From: copeland@fohnix.metronet.com
Message-ID: <3kd5ho$q2n@fohnix.metronet.com>
Source record: 25430

News said today the space shuttle will remain in orbit for one
more day. Will land Saturday.

Does anybody have the kep data for Friday and Saturday?

--

| There are two types of people in this world, those who separate |
| people into groups,and those who don't. KC5LWF copeland@metronet.com|

Why would you make more than one packet contact? They automatically dupe
check their log and toss out all but the first contact. Making multiple
contacts simply denies others the opportunity to make a contact.

585. Time Step Prosat II Autosave

Newsgroup: rec.radio.amateur.space
Date: 1995-03-19 08:31:21 UTC
From: mklee@actrix.gen.nz
Message-ID: <D5oIC9.ILE@actrix.gen.nz>
Source record: 25435

Hi

I have an intermitent problem with autosave receive mode using Time Step Prosat II. I have, on several occasions, set the receive schedule and select autosave mode. However, there are times when it did work and recorded the correct images. However, it is more often that it did not capture the images scheduled.

Has anyone experienced similar problems? If not, then what is it that I am not doing right?

I would hardly say that my three packet connections over the two week mission
denied others of making contact with STS 67 since a contact is about 2 seconds
long. As for the dups, I am aware of this fact, I only QSL'd on one confirmed
packet connection and I did QSL on my phone conact just for grins.

Yeah, I'm looking for an OS/2 PM satellite tracker, too! I
started to use a DOS app. called PC-Track 2.14 then upgraded to 3.04.
PC-T worked fine under OS/2 2.1 and Warp except when I had less then 3
sats. to track the tracking speed seemed to fast. Then I tried PC-Track
3.00 and the session would randomly exit. 3.0 usess DPMI memory and that
may be the reason why it doesn't work. The thing about OS/2 DPMI is that
you can only go in there once when you install a DPMI app and later the
DOS Settings box is greyed out....so back I go to PC-Track 2.14

So YES, I would like an OS/2 satellite tracking program.

Hello out there in Hamspace land...

I just realized when reading through some sat stuff, my Hamcomm program MIGHT be able to get a ROBOT answer from RS-10.
after about 2 hours running around setting up my 2m ht and a scanner for downlink, and finding the right antennas hopeing the computer will not be to bad RFI........it finnaly gets over the horizen, and bang nothing.....maybe my scanner is not good enought, or my keps are old <only 2weeks>

#1. WHY can i not contact it? i send out rs-10 de n3sqe ar but i hear nothing in return....not even the beacon
#2. what IS cw? i tx cw from hamcomm by holding the ptt down...is that right? or should a find a way to acctully put the PTT circuit from HC on my HT?

please help.....

Actually I'd say that the four seconds it took for you to perform your extra packet contacts statistically cost two other people their potential packet contacts. Listen to the packet downlink some times - you can occasionally find blank spots but for the most part the shuttle's packet rig is constantly responding to packet connect attempts. So by being so inconsiderate to make additional attempts to contact the shuttle - even though you realized that you had made a successful contact - you probably prevented somebody else from getting through. Could they have gotten through on a later pass? Possibly, but not certainly.

One inconsiderate person who feels that they have to make additional spurious contacts just to brag that they got through three times is not going to cause many people to miss their possible contacts with the shuttle. But that attitude will hurt, and will prevent people from getting through.

I'm sending a copy of this post to the SAREX working group, with the recomendation that in the future any call sign which appears in the log on more than one pass over a particular location be denied a QSL, or at least sent a note informing them of their inconsideration.

But there's nothing wrong with attempting both packet and voice contacts
on a mission.

Hi Al. Yes, you were for the past shuttle (STS 67) too far north. I can not say that for past shuttle missions, because I am very new to satellites and such.

601. 2-mtr SSB Phone on SAREX

Newsgroup: rec.radio.amateur.space
Date: 1995-03-21 05:17:06 UTC
From: KKEYSEEA@EUROPA.UMUC.EDU
Message-ID: <3klngi$7gg@nova.umuc.edu>
Source record: 25451

I say this jokingly, but maybe it will start an interesting thread:

I, WB4U, hereby volunteer for a future SAREX mission,
intending to take aboard the STS a REAL radio capable of handling
the massive pileups that naturally occur as a result of the
popular SAREX missions. SAREX will transmit on 144.110 SSB and
work stations SPLIT FREQUENCY on SSB that are transmitting in the
range of 144.120 to 144.190. This is a style similar to that used
by the rarest of DX stations on the HF bands.

In this way, the most efficient use of spectrum and power
on board the shuttle will be accomplished. Unattended, the station
will revert to FM packet as seen previously.

OK, so I will not likely win a ticket to ride the shuttle.... but
why has the idea of SSB VHF/UHF not been utilized for SAREX?

best regards (i.e. 73) de WB4U
Ken Keyseear
Gaithersburg MD (FM-19)

At this frequency a parabolic dish with a diam. of about 4'
is a good choice. Some folks prefer home brew wire mesh
dishes because they have less wind load, others use
TVRO dishes, depending on availability.

}hear anything. I copied a strong signal from STS-64, and can only assume
}that this flight is too southerly. Prediction programs never had it higher
}than about 12 degrees here.

If you were transmitting on 145.55, you were on the wrong frequency. All shuttle communications are split. Packet uplink is 144.700. Voice is 144.950Mhz(-600kHz).

>#2. what IS cw? i tx cw from hamcomm by holding the ptt down...is that right?
> or should a find a way to acctully put the PTT circuit from HC on my HT?

The downlink for RS/10 is in the 10m (29.3xxmhz) band, single sideband. If
your scanner is FM it will not receive it. Also it takes a beam of "about" more
than 10 elements aimed directly at the bird to get a good signal in.
CW is continous wave. A radio carrier with no modulation. I really don't
think your scanner will receive RS/10.

By far the most popular is the 2'x3' wire reflector from R. Myers. It is useable on Mode S, but marginal. It suffers from polarity mismatch as well as a not too great a reflector. It does have the advantage of being inexpensive and very easy to mount.

Far better performance would be had from a 3' round dish with a circular polarity feed, but you would need to set up the mounting hardware yourself.

I use a 6' dish and feedhorn, but this is really overkill. The signals are definitely nice, though!

Exactly. Each needless connect is one that can't be made by someone else.

>I'm sending a copy of this post to the SAREX working group, with the
>recomendation that in the future any call sign which appears in the log

A good idea. The software could do a dup-check, and refuse the connect
with a message "You already connected. Please give others a chance!".

I made one with a bit of trouble compare to other flights. I think the
biggest problem was that since it was an astronomy mission, the payload
bay was pointing at space rather than earth. On most passes The signal
was only strong enough for contact on a portion of the orbit. So it took
a little bit of luck and a lot of persistance to get this one. Oh yea,
the 24 degree latitude helped. Oh well, someone has to live up north to
keep the country balanced!

MONDAY MARCH 20, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* NOAA-14 EXPERIENCES FAILURE *
==============================
The motor for the Microwave Sounding Unit on the NOAA-14 spacecraft has stopped working, investigation into the failure is in progress. Records show the unit is from a delivery made to Martin Marietta dating back to 1984. Future NOAA spacecraft will not have this same unit--it will be replaced with a different type. NOAA-14 has been in orbit since last December.

[Info via Pat Kilroy]

* MIR NEWS *
============
Astrounaut Dr. Norm Thagard and two cosmonauts were launched to Mir last Monday and docked with Mir on Thursday. Joe Dreifuss, WA2GSY reported contacting Dr. Thagard on Friday morning at 14:27 UTC on 2-meters. He was using R0MIR as his callsign. Joe reported the downlink signal from Mir was very strong and easily heard even on an HT with a rubber duck antenna.

* UNAMSAT-1 NEWS *
==================
The UNAMSAT-1 spacecraft has arrived in Moscow for a launch from Plesetsk on 28-Mar-95. The launch window begins at 05:00 UTC and ends at 10:00 UTC. UNAMSAT-1 will be carried along with TECHSAT and a Russian communiations satellite on a Start-1 rocket.

The following are the UNAMSAT-1 operating frequencies:

TX1 * default * 437.135 MHz
TX2 437.179 MHz

Telemetry transmissions will start 20 minutes after separation. If the software survives the launch, the beacon will transmit normal telemetry,

otherwise the mailbox will be in operation.

The Rx freqs are:
Channel A 145.922 MHz
Channel B 145.942 MHz
Channel C 145.962 MHz
Channel E/F 145.872 MHz

(Channel D is non-existant)

The receiver will be closed for use other than commanding the spacecraft, but controllers will let make it known when the satellite is available for use as soon as possible.

[Info via David Liberman, XE1TU of the UNAMSAT-1 Team]

I'm not going to deny anyone the chance to make a contact. Some people try many times to get a "worked" contact. SAREX is an experiment. Let's remember that. And the configuration will not always remain the same. I'm not going to deny someone a QSL for multiple contacts. You should only get one QSL card anyway.

The SAREX team does find that there is a lot of packet activity out there and we encourage it. But I feel that we should have better management of the packet frequencies. Packet could be run alot more efficiently and not spread all over the band. Many of the SAREX contacts made during the flight are interrupted by packet bursts. This helps no one.

How about different frequency areas for APRS, space, local, networked, etc. It needs to be enforced.

DARN! Good thing I made a voice contact via 2 meters with Ron WA4SIR in addition to talking to him during the inflight crew conference. (And actually a couple of days before I talked to him during the inflight crew conference).

Actually a hearty hurrah to Matt and the entire SAREX team, especially John and Karen Nickel, Pat Kilroy, the rest of the ground support team, and of course the STS-67 astronauts - even what's-his-face who doesn't have a license.

The SAREX team completed its longest, and most difficult (in many ways) mission to date with a perfect success record. All 26 school contacts were completed, plus many packet contacts and random voice QSOs, even though the primary payload's requirements result in so many attitude pointing requirements that predicting which window to use the antenna in was a major chore.

In any case I wouldn't have bet money ahead of time that all 26 schools would have been completed successfully - and was quite pleased to see it happen.

Hi Jeff and the community,

(sorry for my English, but I can't resit, hi)

SAT-Rule #1: Correct the Doppler shift on the higher frequency.

RS-10/11, RS-15: Tune the 145MHz VFO to correct the Doppler shift.

When you have got some experience via RS-10/11 then you should try RS-15
and give me a call, hi. Few days ago I have worked some guys from the
States with the locators "EN.." and "FN..". My locator is "JO..",
figure it out via RS-15 (I am on 29,370..29,375MHz, USB, sorry no CW), hi.

My Equipment: Groundplanes for 145MHz and 29MHz, 150W output on 145MHz.

Have fun on RS-10/11 ...

#1 Listen for the beacon on 29.357 MHz before attempting the Robot on 29.403. The Robot is somewhat intermittent. There have been times when I could not access it either. Also, you need about 50 Watts ERP From your station to make a solid contact with RS-10. And, even so, if the sat is not high enough (about 25 or more degrees), it may not be able to hear you.

#2 CW utilizes the On/Off keying of a transmitter. By holding down the PTT, you are sending the Robot a continuous carrier. This may result in a continuous carrier back from the Robot. Anyhow, you would have to be able to key your HT pretty fast to respond to the speed range of the Robot.

My advice is: a.) try an amplifier or better yet, b.) try a 2-Meter CW transmitter.

Good Luck and 73

|>

Hi Darryl,

Sure, I'm using a Yaesu FT-726R, a Mirage B1016 amp, 50' of heliax,
GAsFET preamp, and the KLM 14 element crossed yagi. It is the same
system I use for the OSCARs such as AO-13, AO-13, FO-20, and several of
the PACSATs.

Oh yeah, the antennas are mounted on my garage about 15-20' above the
ground with AZ-EL rotors.

I do not know of any native OS/2 sat tracking programs. I know a negative reply doesn't help, but I didn't want your post to go unanswered! I use a dos based sat tracking program, run it either full screen or in a dos window while I also have a dos packet program running in a second window.

Mike

Hi, I was wondering the same thing. There is a program out called traksat for windows, it might just be the one for os/2, but I don't know, and it's not shareware. I've been running stsplus, but it won't run in a window, just in a fullscreen. I have the address and phone number of the guy who wrote Traksat for Windows, but don't have it handy right now. If you want it, e-mail me, and I'll dig it up. He's the same guy who wrote the shareware Traksat, Paul Trauffler, and his address and phone are both in the order docs for that program. You might want to give him a call, but I cannot guarantee that Traksat for Windows will run under OS/2 warp. 73 de Curtis, kd4zkw.

>A good idea. The software could do a dup-check, and refuse the connect
>with a message "You already connected. Please give others a chance!".

Hey, let's calm down here, everyone. This is a problem that can be
dealt with a lot more effectively through education than through
punishment.

First of all, it's entirely possible for someone to not know that
the SAREX packet robot heard them, and thus make further attempts
during that pass or a later one. It's happened to me: a few missions
ago, I was suprised to see my callsign on the HEARD list a day earlier
than I thought I had gotten through.

Second, think about how many uplink attempts the robot would wipe
out if it spent much of its time sending dupe messages.

Third, the SAREX Working Group and the clubs who volunteer their
time to answer the thousands of SAREX QSLs have better things to
do than write letters to people who have duplicate contacts--
especially the single dupe that you two consider so immoral.

Here are my recommendations:

* To the SAREX WG and everyone who's worked the shuttle: Spread
the word far and wide that simply being on the "HEARD" list will
get you a two-way QSL for the shuttle. Since this is a reversal
of an earlier policy, I'm sure that many people still don't know it.

* To the SAREX WG: Consider no longer publishing the "WORKED"
list. It creates a two-level award system even though people really
only have to be on the heard list to get a two-way QSL. I realize
that this might be a controversial suggestion (hey, I'd love to
make that worked list just once myself!), but since the humans
in the WG have already decided not to slavishly follow the SAREX
software's distinction between worked and heard stations in sending
out QSLs, there's no reason they can't just ignore the difference
when they create the contact list.

73,
Patty

p.s. If anyone wants some real dupe-crazy lids to go after, try
helping with the QSLing for a major DXpedition sometime. Like
the guy who made nearly 30 QSOs with a South Pacific DXpedition
a few years ago....We didn't write him a letter--or toss out all
his QSOs--but we were sure tempted.

The "scanner" is listening at the _beacon's_ downlink frequency, right?,
not the transponder's downlink> The beacon transmits
on 29.454 MHz or somewhere around there.

Anyway, the procedure is to first listen for the beacon calling for
robot contacts in CW. Then transmit a series of dits on the uplink while
you tune the frequency through the robot uplink frequency till you hear
your signal in the beacon. This is quite a thrill, as it is appreciably
stronger than the transponder's response. When you're in the window,
transmit RS12 DE N3SQE as clearly as you can. It will respond and give
you a qso number. Make sure you copy the number. You might even want to
tape record the QSO so you can get the number right.

You may not be able to hit the uplink window with an HT because the
frequency changes in 5 kHz steps. I used a
partially disabled (no SSB) all-mode XCVR for the 2 meter uplink just so I
could fine-tune the frequency.

My own experience with the robot was pretty comical. I'd follow all
the instructions and get no response from the robot except that it would
retransmit my transmissions. Over and over. Then some other stations
would step up and get a QSO number on the first try. ...And I'd try it
again. No go. This was a year or 2 ago. Just a few months ago, I
tried the procedure and it worked. I have the QSL card in my office
at work.

Good Luck! - AL

626. PK232 & WISP

Newsgroup: rec.radio.amateur.space
Date: 1995-03-24 20:58:24 UTC
From: billh@gn2.getnet.com
Message-ID: <3kvbpg$19t@infoman.net99.net>
Source record: 25326

I'm having an irritating little problem with WISP. About 3 of5 times it finishes a pass and exits it kicks the PK232 TNC out of KISS mode. If I let it go on into the next pass it goes in with MON 0, KISS off, and HB 9600 which obviously won't work. I've gotten in the habit of running a comm program every time I start up just to make sure TNC is set right.

Anyone having similar problems or got an idea how I can fix it.

From: tkelso@afit.af.mil
Message-ID: <tkelso.796087743@eel>
Source record: 25327

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

I have a friend who is trying to decide on either
the IC738 or the TS 790 trancievers.
I like the FT 736 myself but he wants the dual band
receive function.
Whats the opinions of net?
Thanks
73, Roland

629. AO-27 Surprise!!!

Newsgroup: rec.radio.amateur.space
Date: 1995-03-25 16:33:24 UTC
From: n2aam@starcomm.overleaf.com
Message-ID: <D608nt.40v@starcomm.overleaf.com>
Source record: 25329

I knew the receiver on AO-27 was hot, but I never realized how hot until I was able to work through the bird using my hand held with 5 watts with the rubber antenna as an uplink.

I was on the 1538utc pass this morning. At my location in Metuchen New Jersey the bird achieved a maximum elevation of 60 degrees. While listening to the downlink using my Kenwood 811a and Klm 40cx with ARR gaasfet I transmitted using the portable. I was able to hear my signal with just a little noise. I successfully worked a station in 8 land who gave me a good report.

Now if I can hear the bird with my uhf portable I would like to see if it is possible to communicate through the satellite without the big antennas in the loop.

Congratulations to the folks at Amrad for building and operating such a nifty satellite.

Dave Marthouse n2aam

630. Newbie Question.. Had license for 1 WEEK

Newsgroup: rec.radio.amateur.space
Date: 1995-03-25 17:24:00 UTC
From: scruz@cc.weber.edu
Message-ID: <25MAR199510242819@cc.weber.edu>
Source record: 25330

I am new to all the possibilities of using a sattelite to talk. I live in Ogden, UT and even attend Weber State University, home of WeberSat. What I am curios about is whether I can use a sattelite with my HandHeld. I am using a Kenwood TH-79A. If so would anyone be willing to give me some advice, pointers, or just plain instructions for the sattelite illiterate.

Thanks
Marc

From: jimn2ete@aol.com
Message-ID: <3l21ci$gt9@newsbf02.news.aol.com>
Source record: 25332

I am having trouble with GZip. I can't seem to decompress a file that is compressed with a .z extention (or more clearer L-Z compression). I seem to follow the instructions that is in the documentation, and I wrote the directory in the SET PATH in my autoexec.bat file, is there anyone who has experience with
UNIX or with that paticullar program?? This is for satellite kep data decomp.

Jim N2ETE

Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc,rec.radio.amateur.antenna

The ADRS Web Pages describe and give information about the ADRS, its publications and services, and contain what is now probably one of the most complete set of hyperlinks connections to other amateur radio related WWW sites and related Internet sites worldwide! You are invited to visit the ADRS WWW Pages at: http://www.iea.com/~adrs to learn more about ADRS and as the best starting point for exploring amateur radio on the Internet! To use the ADRS WWW site, you need will need an access to the Internet which permits you to use Mosaic, Netscape or a similar Web Browser which provides HTTP (Hyper Text Transfer Protocol) capability. (The new Prodigy Internet WWW Web Browser was tested and performs well.)

It's a nice start, but most of the documents are .ZIP files, which i can't read (at least, not very easily) on a Mac, and 'man -k zip' doesn't tell me how to do it on a UNIX box, either. So:

Click here now to download a series of 26k zipped text files with basic information about how to implement such a gateway!

is of no help to me. If files are to be compressed, please use a widely available or understood tools, such as the GNU software, as is done by folks with the U.S.G.S. for the FTP'able map data. Please don't assume an MS/DOS platform!

I just picked up a set of KLM antennas today at a swap meet and have a VSWR problem in the 22C one of the set. I get about 3.5:1 or so which seems to say that the LH/RH switch is open. Has anyone had a failure in the KLM's before like this and is there a easy way to fix ? I will jumper around the switch and see if the VSWR drops to something like it should and will try a fix on the switch at a later date. BTW does anyone know which of the two terminals on the 22C is the one for RH cp and which is LH cp ?
Thanks in advance Steve N6CRR

LH

The relay connects the center conductor of the coax to either the left or right side of the loop. Try applying 12 volts to the relay and see if the VSWR comes way down. If it does, the relay contacts *might* be bad, but also the connection to the loop can get corroded. Clean all of the connections on both loops and try again.

If it turns out that the relay is bad, it is a rather simple matter to put a better relay in a sealed box and weatherproof the connections. I did this for about $15.00. I also sealed up the loops completely with 30 year caulk, as water in them will drive the VSWR way up.

>by the rarest of DX stations on the HF bands.

Primarily, SAREX is public-relations and wants to appeal to the widest
possibleham audience. I too get a quesy feeling when my radio isn't in the SSB
mode,but there are a LOT more FM radios out there.
Secondly, (proper useage?) the radios taken aboard must be space-worthy,
reliable, compact, industrial grade equipment. I think they are Motorola brand.
The typical amatuer SSB gear isn't up to space travel.
I have some knowledge of this subject through my volunteer work with
Arizona State University's amatuer satellite project. You do make some good points
and perhaps you will be the one.

>bad RFI........it finnaly gets over the horizen, and bang
>nothing.....maybe my scanner is not good enought, or my keps are old <only
>2weeks>
The RS 10 robot is very picky about quality of tone, tuning and sending speed.
The computer should give consistent speed, but the tuning and tone of an
FM radio may not be good enough. And of course you must here the bird first.
Is your scanner capable of recieving CW, it would need a BFO. A typical
'police/fire' FM scanner will not hear the AM signals of CW or SSB.

Good luck and 73 Jim

I want to throw in my 2 cents worth here.

With narrow transponders like RS birds (40KHz) the transmit frequency should be shifted for doppler comp. This prevents the QSO from sliding across other QSOs. With wider transponders like the Oscars, the problem is less severe. I have recorded total shifts of 7KHz using RS 10.

>KC7JKF

Welcome aboard Marc.
The satellites you can access with a handheld for voice communication are limited.
In fact, I think only AO-27 on an erratic, weekend mostly schedule is working.
Get some shareware tracking programs, learn more about the birds and save for
a Single Side Band 2 meter radio. Then you'll be able to work the RS series. The
downlink is on 10 meters and a portable shortwave reciever is good enough.

Does anyone have a TM255 (or at least played with one)?
This is a new 2-meter all-mode rig, that sort of
superficially resembles a TS-50.

I'm wondering if it is suitable for working RS10 and maybe
AO-13. Some specific questions I had:

1- Can you put a CW filter in it?
2- Does it have a computer-control interface?

Thanks a lot,

The Macintosh StuffIt Expander tool available as a public domain peice of software can be linked within Netscape and Mosiac both to handle the uncomression of a ZIP'd archive... I use it all the time... and it works very well.

Granted.... in the this world of clones... most of them 80x86 versions... there are many assumptions made about platforms. But fourtunately the Mac software community identifies it and compensates for it.

If you need a path for accessing the StuffIt package... let us know... and I am sure someone can assist.

The Mac program "Stuffit Expander" by Aladdin will unzip dos files just fine (drag and drop). Also, "Unzip" and "Zip-it" work as well & "Bbedit" will allow reading/writing in Mac/DOS/Unix format.

All of the above are available on most Mac internet sites.

The problem is that there is no satellite loaded into the map tracking.
To get one in, set GSC to track a satellite in the text box at the
bottom, and then double click on the text for that satellite. You will be
given some choices. Choose 'Display On Map'.

This should get the map working, and only needs to be done oncce.

$*$*$ 30 Weak Signal Challenge (HAM Post) - Now $40 $*$*$

Five weeks have passed since the original posting of this challenge.
During that period, the Web page was accessed over 1000 times.
The weak signal recording has been listen to and processed by
many. Several operators using their best audio filters have been
able to copy my call. And yet, a correct identification of the calling
station has not been made. I am increasing the amount offered to $40
and will continue to escalate the prize until someone cracks the problem.

Details on the challenge can be obtained from my Web page:

http://www.webcom.com/~af9y/

If you do not have a Web Browser, you can ftp the following:

FTP ADR: ftp.webcom.com/pub/af9y/www/

Sound File: unkn422.zip This is the Zipped Wav File

Ref Files: af9ypage.zip GIFs of AF9Y Web Page (with challenge info)
fftdsp38.zip FFTDSP Demo Program
fft422.zip View of unkn422 in next release

The winner will be announce in the UseNet groups carrying this post
and my Web page.

Final Note for those trying their own signal processing techniques:

Many have asked about the WAV file format used for the
A/D recording. The format is a PC Windows standard which
contains 43, 8 bit-bytes of header (which can be thrown away)
followed by a consecutive series of 8 bit A/D data. The sample
rate was 8192 samples/sec.

Good Luck,
de Mike Cook - AF9Y

Marc --

Congratulations and welcome to ham radio. In a separate message, I'll be sending you CQ Magazine's new ham welcome pack. To answer your specific question (Can I work a satellite with an HT?), the answer is, in theory, yes. OSCAR-27 has an FM repeater (which shares times with other modes) with an input (uplink) on the 2-meter band and an output (downlink) on 70 cm (about 435 MHz). You would need either two HTs (making sure the 70cm one is capable of receiving below 440 MHz) or a dual-bander that lets you transmit on one band while listening to another (many do). Of course, there's a lot of competition for the bird, so it may take several passes for you to get in. But it's sure fun to try!

There's a lot more info on the basics of operating amateur satellites in the CQ video, "Getting Started in Amateur Satellites." If you'd like more info, just drop me an e-mail message and I'll be happy to fill you in.

Frequencies of amateur satellites are published in the annual "CQ Amateur Radio Almanac", "The VHF How-To Book" (both published by CQ), the "ARRL Operating Manual" (ARRL) and various AMSAT publications. Schedules vary and are updated regularly online. If you send me an e-mail message, I'll be happy to tell you how to get any of these 3 books, and how to contact AMSAT for theirs.

SOnealCA <sonealca@aol.com> wrote:
>I just picked up a set of KLM antennas today at a swap meet and have a
>VSWR problem in the 22C one of the set. I get about 3.5:1 or so which
>seems to say that the LH/RH switch is open. Has anyone had a failure in
>the KLM's before like this and is there a easy way to fix ?

I too obtained a KLM antenna at a swap meet although mine is the smaller
2M-14C. I think it uses the same parts as the 22. After fooling with
this antenna for more than a year I can offer this advice: Remove the
relay assembly and discard it. You will be much better off. During the
times that I did get it to work I never got better than 1.5:1 and the
LH polarization mode only rarely helped reception. Others may disagree
and I welcome the responses.
Without relay and fixed at RH I can reliably receive AO-10 and AO-13 while
SWR is around 1.2:1. You will need to solder some terminals on the coax
ends from the phasing harness that went to the board. Do not shorten!
To verify RH polarization, stand behind the antenna. Observe which side of
the REAR folded element has the center lead of the phasing harness connected.
The FRONT (farther) folded element should have the coax center connected to
the element that is 90 degrees clockwise, or to the right.
If you insist on using the relay, buy a whole new assembly, PN# CS-3
which includes phasing harness for about $35. Call KLM Antenna at:

206-794-2923

I would appreciate someone sending me the element dimensions and spacing
for the 2M-22C so that I can model it and compare against my 2M-14C.
I have an old Amsat Orbit magazine with an article describing how to
add two elements to each plane of a 2M-14C. I modeled this and found
that it added slightly more than 1dbc for about another 4 feet of boom.
I slightly remember that my 2M-14C models at about 9.5dbc in stock form.
I use K6STI's MN 4.0 to model these is free space.

655. Balloon Launch April 8 - Wisconsin

Newsgroup: rec.radio.amateur.space
Date: 1995-03-27 22:29:20 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3l7e80$2c6@news.doit.wisc.edu>
Source record: 25356

The Badger Amateur Radio Society and the High Altitude Radio Project
announce
The Launch of the BARS 1 Weather Balloon

Launch Date: Saturday, April 8, 1995 (Rain dates April 9 and Easter Weekend)
Launch Time: 9:00 - 10:00 AM CDT (14:00 - 15:00 UT)
Launch Site: Hillsboro, Wisconsin (About 20 miles W. of Wisconsin Dells)

ATV transmit freq: 439.25 3 watts Color
GPS/APRS Packet TX: 441.05 2 watts 1200 baud packet
Cross-Band Repeater Output: 439.25 3 watts FM (Same as ATV output)
Cross-Band Repeater Input: Two Meters - frequency to be announced.

Note that the crossband repeater output and the ATV transmitter are on the same frequency. The ATV transmitter's carrier is FM Modulated with the voice signal. The voice and TV signals don't interfere with each other.

This flight will be BARS' entry in the 1995 University of Wisconsin Engineering Expo, a bi-annual display of student engineering prowess that is scheduled for April 21-23 on the University of Wisconsin, Madison campus.

This will be a weather balloon carrying a color TV camera, an ATV transmitter and a crossband voice repeater. The balloon will also carry a Global Positioning Receiver and a packet transmitter that sends lattitude, longitude and altitude in a format that can be used by the APRS packet program to draw a map and plot the balloon's position on it. This will be a standard ASCII packet signal and people without the APRS program can read the balloon's position directly with their regular packet gear. No connects or digipeating through the balloon will be possible.

After the flight, the payload and video tapes of the balloon signals will be displayed at the University of Wisconsin's Engineering Expo, which runs from April 21-23 (the weekend after Easter).

The winds aloft are quite vigorous at this time of the year. Typical wind speeds reach 40 to 100 miles per hour or higher. If the winds are heavy on launch day, we'll try to keep the maximum altitude down to about 50,000 ft to keep the balloon from landing in Lake Michigan. If winds are light, we'll go for 100,000 feet.

Balloon chasers are very much wanted and everybody is invited to join the chase. You don't really need any DF equipment - if you're a hunter with a good pair of boots, you may be worth your weight in gold if the balloon lands in a bad location. People who can climb trees may be just as valuable.

The launch will be announced on the Baraboo 146.88 repeater the morning of April 8th. We expect to do most of the chase-crew co-ordination using the balloon's cross band repeater.

MONDAY MARCH 27, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited free distribution.

* UOSAT-5 NEWS *
================
The OBC-186 aboard UO-22 crashed during the early morning hours of
21-Mar-95. This is the third crash of the '186 in just over a month.
While one of the crashes has been completely explained, the other two have
not. As a result, ground controllers have spent the passes over the UK
this date dumping the memory of the flight computer. It is expected that
the dump should be completed in time to begin the reload process during
the morning passes over the UK on 22-Mar-95.

Controllers will attempt to have the reload completed as soon as possible
and will provide additional information as details become available.

Doug Loughmiller, G0SYX / KO5I
UoSAT Spacecraft Operations Manager

* MIR NEWS *

* STS-67 WRAP-UP *
==================
Endeavour landed safely at Edwards AFB on 18-Mar-95, setting a new endurance record for the orbiter of 16/15:09:46. The orbiter passed over the California coast and a powerful sonic boom was hear (and felt) throughout the Los Angeles area. The approximate landing times:

RPV Sonic Boom: 13:41:36 PST (BOOM BOOM!)
Main Gear: 13:47:00 PST 16/15:08:47 MET
Nose Gear: 13:47:14 PST 16/15:09:01 MET
Drag Chute Deploy: 13:47:17 PST
Drag Chute Jettison: 13:47:43 PST
Wheel Stop: 13:47:59 PST 16/15:09:46 MET

[Info via Ken Ernandes, N2WWD]

* NEWS CORRECTION *
====================
MBL is the Microsat Boot Loader. It sends telemetry in a format different from the format used when Microsats are in "normal" operation. It sends packets every 2 or 3 minutes depending on a number of factors and is designed to give controllers minimal telemetry when the spacecraft is reset. It runs from code stored in an EPROM and contains loader software used to load the normal operating software.

The UNAMSAT-1 satellite will begin telemetry transmissions 20 minutes after separation. If the software survives the launch, the beacon will transmit norma telemetry, otherwise the spacecraft will be in MBL mode (as opposed to "mailbox" mode as reported in last week's issue of SpaceNews).

Thanks to Jim White, WD0E, for the correction and the background information on MBL.

* NASDA NEWS *
==============
The National Space Development Agency of Japan (NASDA) launched the third H-II Launch Vehicle test flight (H-II TF#3) from Tanegashima Space Center with the Space Flyer Unit (SFU) and Geostationary Meteorological Satellite-5 (GMS-5) at 05:01:00 JST (=UTC+9h) PM on March 18, 1995 at a launch azimuth of 97 degrees.

The flight of the first and the second stages was normal, and the guidance and control system functioned as planned. The Space Flyer Unit (SFU) was separated approximately 13 minutes 16 seconds after the launch, and GMS-5, at 27 minutes 47 seconds after the launch. All flight events of H-II TF#3 were completed.

The data from the SFU after the first revolution was received at 06:37 PM (JST) on March 18 at the Sagamihara Operation Center, ISAS. The data confirmed that the SFU was injected into the proper orbit.

NASDA also launched GMS-5 "HIMAWARI-5" at 05:01 PM (JST) on March 18, 1995 from Tanegashima Space Center. The data from the satellite after the first revolution was received at 06:25 PM on March 18 at Madrid Tracking and

Data Acquisition Station.

The Data calculation confirmed that "HIMAWARI-5" was inserted into the first transfer orbit as planned.

The first transfer orbit is as follows:

Apogee Altitude: 36669 km
Perigee Altitude: 329 km
Orbit Inclination: 25.1 degree
Period: 10 h 50 m

The command for the apogee kick motor firing will be transmitted at 09:57 on March 19 from the Tracking and Control Center at Tsukuba Space Center.

The Sagamihara Operation Center, ISAS confirmed that the SFU normally completed the solar array paddle deployment at 07:25 PM (JST) on March 18, 1995. The SFU is functioning normally after the solar array paddle deployment.

Data calculation confirmed that the SFU was placed in the designated orbit.

The orbit determination is as follows:

Apogee Altitude: 336 km
Perigee Altitude: 322 km
Orbit Inclination: 28.45 degree
Period: 1 h 31 m

The SFU was found to be functioning normally.

NASDA transmitted the apogee kick motor (AKM) firing command of "HIMAWARI-5" at 09:54 AM on March 19 (JST) from Tracking and Control Center at Tsukuba Space Center. The AKM firing and AKM adaptor separation were normal. "HIMAWARI-5" was confirmed to have been successfully moved from the transfer orbit to the drift orbit.

> Secondly, (proper useage?) the radios taken aboard must be space-worthy,
>reliable, compact, industrial grade equipment. I think they are Motorola brand.
>The typical amatuer SSB gear isn't up to space travel.

Jim, the assumption that typical amateur SSB gear isn't rugged enough or
that some brand of commercial equipment is more reliable, is commonly
accepted at face value, however the temperatures in the module and the
G forces at takeoff are tolerable to the human body which has rather narrow
environmental limits. Look at the temp and G force specs for typical
Ham gear and compare them with what our bodys can tolerate.

I believe Icom, Yaesu, and Kenwood have mil-spec rated equipment that
only needs to be space certified to be included as part of the flight
system. If the radio was merely used for hobby purposes (Amateur Radio)
then certification shouldn't be required.

From: Paul Ross <paul@paulross.demon.co.uk>
Subject: [*] MacGPS 45 version 0.1; exchanges data with Garmin 40 or 45 GPS

MacGPS 45 version 0.1 is a freeware program to upload and download data between a Mac and a Garmin 40 or 45 Global Positioning System (GPS). Written by John Waers (jfwaers@csn.org).

Current positional data can be transfered to the Mac real time using the NMEA protocol. Almananc, waypoint, track and route data can be uploaded to the GPS or downloaded to the Mac using Garmins proprietary protocol.

Apart from John's manual I have included a Read.me file to help users with the wiring of the GPS to the Mac modem port.

It isn't that typical ham
>gear can't stand the trip, it's that it's outgassing products and
>spectral compatibility with spacecraft systems are unknown.

I understand your point Gary. Your description of the problem was well
put. Heating the device under test while pulling a vacuum to cause the
outgassing should yield a sample that could be analyzed by a gas chromatograph
in a matter of minutes, thereby resolving whether the device is compatable
with the flight systems. (I am assuming that the flight systems compatablity
with common elements and compounds used in the manufacturing of electronic components
is known.) |

HIGHLIGHTS OF MAY, 1995 "CQ" MAGAZINE

Copyright 1995 by CQ
Communications, Inc.

Results of the 1994 CQ World-Wide WPX CW Contest highlight the May, 1995, issue of "CQ", along with a fascinating report on the 9G5TL DXpedition to Ghana for the 1994 CQ World-Wide DX Contest.

Operating a DXpedition station during a major contest is the dream of many an avid DXer and contester. But imagine doing it from a country that, just two years earlier, had considered it a crime to operate a ham radio station. "The 9G5TL Story," by Warren Hill, KF7AY, tells the exciting tale of planning and preparing for this ham radio adventure, the thrills of operating from a rare country during the biggest contest of them all, and of the long-term benefits of the operation to ham radio in Ghana.

The 1995 CQ WW WPX Contest is now history (for the uninitiated, that's short for the CQ World-Wide Worked All Prefixes Contest, in which you try to contact as many stations with as many different callsign prefixes as you can during a 48-hour period). And the results are in from the 1994 event. May's "CQ" magazine reports fully on the CW portion of the contest. Here's a brief list of the trophy winners:

Single Operator, All Band --
-- World: John Crovelli (W2GD), P40W
-- USA: Tyler Stewart, KF3P
-- Oceania: Michael Sato, AH6MZ
-- Canada: John Sluymer, XL3EJ
-- Canada, low power: Gary Caldwell, XL7NTT
-- Japan: Satoshi Hara, JH5FXP

Single Operator, Single Band --
-- World: Martin Monsalvo AZ4F (LW9EUJ)
-- World, 7 MHz: Bob Furzer, 9K2ZZ
-- World, 3.5 MHz: Pavel Vachal, OK1DXS
-- Oceania: Boyet Lorenzo, 4F3AAL
-- USA: John Yodis, K2VV

-- USA, 28 MHz: Phil Koch, K3UA
-- USA, 21 MHz: Scott Jones, WR3G

Multi-operator, Single Transmitter --
-- World: Station ZX0F (PY0FF & YU1RL, operators)
-- USA: Station WC4E (WC4E, K1ZX, G4BKI/W4,
WB4BBH, W1CW, W1YL, operators)

Multi-operator, Multi-Transmitter --
-- World: Station 9A1A (9A2OG, 9A2DQ, 9A2EU,
9A2LJ, 9A2NJ, 9A2KL, 9A2AJ, 9A3GW, 9A3TW,
9A3NR, 9A3TF, 9A3MJ, 9A4WW, F2CW, S58KW,
operators)

Contest Expdition --
-- World: Station HV4NAC (I2UIY & I2VXJ, operators)

Combined SSB/CW --
-- World: Jim Neiger, N6TJ (ZD8Z)
-- Europe: Gerard Parat, F6FGZ
-- USA: Tyler Stewart, KF3P

Club (SSB/CW) --
-- World: Northern California Contest Club
-- USA: Yankee Clipper Contest Club

The May issue of "CQ" magazine should be in subscribers'
mailboxes and on the newsstands by late April. "CQ-The
Radio Amateur's Journal" is the leading indepndent ham
radio magazine in the US. It is celebrating its 50th
anniversary in print during 1995. To contact CQ or its
authors online, send e-mail to any of the following
addresses: CQMagazine@aol.com, CQ@genie.geis.com, or

>then certification shouldn't be required.

Certification is most definitely required. It isn't that typical ham
gear can't stand the trip, it's that it's outgassing products and
spectral compatibility with spacecraft systems are unknown. In the
very closed environment of a spacecraft cabin, outgassing products
from equipment is a critical factor to crew health. And naturally,
any spurious products, that might not matter at a terrestrial ham
shack, could cause problems for the complicated systems on the
Orbiter. This is somewhat similar to the concerns over amateur
equipment usage on commercial airliners, only very much more so.

Gary

664. Orbital element FTP addresses

Newsgroup: rec.radio.amateur.space
Date: 1995-03-29 00:00:00 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3lckmm$1lja@news.doit.wisc.edu>
Source record: 25464

Internet FTP sites for Orbital Elements

ftp.amsat.org /amsat/keps/current
amsat.all has all hamsats plus selected others in "AMSAT" Format
nasa.all same satellites in "NASA Two Line" format

archive.afit.af.mil /pub/space

Home of the TLE.nnn files posted by T.S. Kelso, the father of
amateur satellite tracking. Includes individual files sorted by
type of satellite and a larger list made of all the little lists
added together.

kestrel.umd.edu /pub/wxsat/elements

Also WxSat & Radar GIFs, software

kilroy.jpl.nasa.gov /pub/space/elements/molczan
/pub/space/elements/satelem

This site has the Mother Of All Element Files in the
/pub/space/elements/satelem directory. Prepared by Allen
Thomson, it's 1/4 meg in the .Z compressed format and
expands to about 1/2 meg when uncompressed. It holds
elements for just under 4000 satellites! No sat names are
given, just the NORAD numbers, so you'll need a cross
reference.

Ted Molczan's Canadian Space Society's element files are in
the /pub/space/elements/molczan directory. This is a more
reasonable length file that includes elements for spy sats.

seds.lpl.arizona.edu /pub/sat/molczan C.S.S. tles w/spy sats
/pub/sat/satelem T.S. Kelso elements

This site appears to be mirroring kilroy's element directories.
If the .Z is left off the file names, seds will uncompress the
file for you before sending it. This doubles transmission time,
but if you can't decode .Z'd files, this will get the files for
you anyway.

DOS users: ftp gzip.exe from /pub/space/elements at kilroy
to uncompress these files at home.

MAC users: get ZIP-IT from any Info-Mac archive mirror.

(Dave Mullenix, N9LTD, djmullen@facstaff.wisc.edu)

I've been a long time satisfied user of Orbittrack. It's an extremely reasonably priced shareware program, and the downloadable software is the complete operational version, without anything 'held back' until you pay your registration fee. The hardcopy documentation is pretty good, although a beginner may have difficulties with the more sophisticated capabilities.

The program will let you track many spacecraft at the same time (the practical limit is how cluttered you want your screen to be), lets you export text data into other programs, creates several different types of outputs and tracking solutions, and lets you use several different standard gravitational models for the Earth. A Az-El controller can be accessed via a serial cable, although it has to be a particular 'smart controller' (e.g. a particular model which has an RS-232 port).

The only major complaint I've heard about its capabilities is that it doesn't calculate squint angles or generate operation schedules, important if you're an AO-13 user.

Still, it has excellent capabilities, and I highly recommend it - it's one shareware program where I actually sent in the registration fee!

From: kebsch@pdb.sni.de
Message-ID: <3lebtf$4d6@nanette.pdb.sni.de>
Source record: 25469

Hi fans of the RS-15 Satellite,

during the last few days I had some QSO's with some HAM's from the US-States
(Locators ENnn and FNnn)

My Equipment:

Antenna 145 MHz: Groundplane
Antenna 29 MHz: Groundplane
Rig for 145 MHz: IC-820H plus a "150 Watt PEP output" linear
Rig for 29 MHz: IC-738

I need better antennas, but how to explain it to the best of all wifes, hi?!

In the evening (~15:00-22:00 UTC) when RS-15 covers NA and EU you may hear
me calling on 29.380 MHz or 1..5 kHz below, hi.

At last not least a simple question: Why I have never heard some HAM's from
Canada? Very often RS-15 covers a very large part of Eastern Canada and a
large part of Western Europe too!! Is RS-15 and/or the 2m band (145 MHz) not
very popular in Canada? Who has an idea???

BTW: Sometimes RS-10/11 *and* RS-15 are covering Europe at the same time.
Then I am quiet, just only listening. I have a lot of fun about
the confusion ... hi.

Have fun ..

The certification issue is definitely not a smokescreen. It took an enormous effort to get NASA to approve the Motorola HT currently used. I expect that most any ham equipment would ultimately be Ok on the Shuttle, but you have to prove that to NASA first, and they aren't going to be easy to convince.

No argument. The SAREX team made an excellent choice of frequencies and modes for the objective they intended to meet. Besides, can you picture NASA allowing a Zepp to be trailed behind the Shuttle to work with your TS940? :-)

From: roger73@aol.com
Message-ID: <3lfvju$e8b@newsbf02.news.aol.com>
Source record: 25475

I recently worked the robot on one of the Russian satellites and when I was about to fill out a qsl for it I suddenly realized something. I have never seen anything in QST, CQ, or the Amsat bulletins about the correct way of filling out satellite qsl cards. I know it sounds simple. I have been a ham almost 40 years and have filled out thousands of qsl cards; but never for a satellite qso before. I can think of many variations and want to know the proper way one is filled out.
In the "TO" or "RADIO" blank do I write Robot/RS-12, RS-12 Robot, etc? If I had made a qso with another station would I say W1XYZ@RS-12, W!XYZ on RS-12? For the frequency do I use just the uplink, or uplink and downlink? Does anyone print qsl cards specifically for satellite qsos?

Certification is most definitely required.

Gary the bit about certification is a smoke screen. The equipment will pass.
The problem is two fold

1.the astronauts do not have time to fool around with
the dials and try to make ssb work they are using KISS mode equipment.

2. They are attempting to reach the most people possible in the shortest period
of time. Face it more people have FM than SSB.

Lets kill this disagreement by saying that they are doing a really good job of
making all hams a part of their world.

We should maybe cut the CQ guy a little slack. He's a newbie on here and probably doesn't understand the culture. I actually like having magazine content lists to see if I want to bother to hunt for an issue on the newsstands. Someone is doing it for QST, and now we have CQ doing it for their rags. If you save these posts, you'll have a crude searchable database of magazines.

However, our CQ friend is *spamming* the ham groups with these posts, and that should *stop*. He should learn about *crossposting* rather than posting the same articles over and over in every group. Better still, he should restrict the postings to the rec.radio.info group where they really belong.

> Any pointer?

Hi Rick, here's a little something I picked up a while ago, hope
it helps.

kilroy.jpl.nasa.gov /pub/space/elements/molczan
/pub/space/elements/satelem

This site has the Mother Of All Element Files in the
/pub/space/elements/satelem directory. Prepared by Allen
Thomson, it's 1/4 meg in the .Z compressed format and
expands to about 1/2 meg when uncompressed. It holds
elements for just under 4000 satellites! No sat names are
given, just the NORAD numbers, so you'll need a cross
reference.

Ted Molczan's Canadian Space Society's element files are in
the /pub/space/elements/molczan directory. This is a more
reasonable length file that includes elements for spy sats.

seds.lpl.arizona.edu /pub/sat/molczan C.S.S. tles w/spy sats
/pub/sat/satelem T.S. Kelso elements

This site appears to be mirroring kilroy's element directories.
If the .Z is left off the file names, seds will uncompress the
file for you before sending it. This doubles transmission time,
but if you can't decode .Z'd files, this will get the files for
you anyway.

DOS users: ftp gzip.exe from /pub/space/elements at kilroy
to uncompress these files at home.

MAC users: get ZIP-IT from any Info-Mac archive mirror.

681. *** SatTrack V3.1 Release Announcement ***

Newsgroup: rec.radio.amateur.space

Cross-posted to: sci.space.shuttle,rec.radio.amateur.space,sci.geo.satellite-nav,rec.video.satellite.tvro,comp.windows.x.apps,sci.astro,de.comp.os.linux

March 31, 1995
SatTrack V3.1 has been released.

SatTrack is a satellite orbit prediction and realtime tracking program with
X Window System color graphics displays. The program has been written in
C language and runs on a number of different Unix and Linux systems with
X11R5. It not only displays in realtime where a number of satellites are but
is also capable of controlling suitable ground station equipment, like
antennas or optical telescopes, and radio communications hardware. In the
autotrack mode it switches between various satellites as they rise and set.
Predictions of passes of satellites over specified ground stations can be
run off either interactively or in batch mode.

For detailed on-line information check the new SatTrack WWW Home Page at:

http://ssl.berkeley.edu/isi_www/sattrack.html

The distribution file sattrack-3.1.tar.gz (or sattrack.V3.1.tar.gz) is also
available from:

ftp.amsat.org/amsat/software/Linux
ftp.jnvc.net/priv/kupiec/sattrack

686. Recruiting Elmers from the Internet

Newsgroup: rec.radio.amateur.space
Date: 1995-04-01 00:00:00 UTC
From: pschleck@gonix.com
Message-ID: <pschleck.796747779@gonix.com>
Source record: 25486
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radio.amateur.space

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself).

As noted elsewhere, the Amateur Radio Elmers Resource Directory is 4 years old as of last month. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire list every 2 years, I am constantly scouring the newsgroups for new Elmers to join the list.

There's always been an implicit invitation for any qualified person to join the list. However, since I've lost about 1/3 of the list due to attrition from my last biannual mass-ack (i.e., no response at their last-known E-mail addresses), felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the list right now include:

- Military Affiliate Radio System (MARS), particularly Army and Navy/Marine-Corps. MARS (as I currently don't have any MARS Elmers from those branches)
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats and SAREX)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)
- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to,

existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. In the 4 years I have managed the list, only a handful of Elmers explicitly resigned, and usually only because of severe professional or personal obligations, or their interests or expertise changed. You don't even need access to netnews, just a reliable E-mail address.

I've also attempted to seek out people on the net who I think would be good Elmers. If you've received a personal E-mail invitation from me, I urge you to give it serious consideration. The net would appreciate your volunteerism.

If you'd like to volunteer, or just discuss further what volunteering would involve or if your contribution would be desirable and fit within the Elmers List's mission and editorial policies, send me some E-mail to the Elmers list administrivia mailbox below (the default Reply-To: of this message; an autoreply daemon will respond with an acknowledgement message and I'll be in touch with you personally very soon).

Hi

Sorry but dont wsate your time - ARSENE is long dead and never really got off the ground 'excuse the pun' as its
transponders failed on launch and very shortly after entering orbit.

Source record: 25493

Folks have tried to find a plug to fit the power / data socket on the Garmin 45, but without success. Perhaps the actual connector is available (for less than $30) from the original manufacturer. A long shot, I know, but perhaps.

If you have the official cable, would you please examine it closely and post if there is any manufacturer's name or logo on it? Thank you.

ARRL BULLETIN 31 ARLB031
FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 30, 1995
TO ALL RADIO AMATEURS

SB QST ARL ARLB031
ARLB031 2 AMATEUR SATELLITES LOST

TWO AMATEUR SATELLITES WERE LOST WHEN THEIR LAUNCH VEHICLE EXPLODED.
THE ISRAELI-BUILT GURWIN-1 TECHSAT AND THE MEXICAN UNAMSAT WERE PART
OF THE PAYLOAD OF A RUSSIAN SS-25 ROCKET ORIGINALLY BUILT TO CARRY
BALLISTIC MISSILES AND RECENTLY CONVERTED TO LAUNCH SATELLITES.
THE REUTERS NEWS AGENCY SAID THE ROCKET, WHICH WAS LAUNCHED FROM
RUSSIA'S PLESETSK COSMODROME, CAME DOWN IN THE RUSSIAN FAR EAST,
IN THE SEA OF OKHOTSK, ON MARCH 28.

BOTH SATELLITES WERE DESIGNED FOR PACKET RADIO REPEATER USE.
GURWIN-1 TECHSAT WAS BUILT AT THE TECHNION-ISRAEL INSTITUTE OF
TECHNOLOGY IN HAIFA AS A 9600-BIT/S PACKET STORE-AND-FORWARD
SATELLITE. UNAMSAT WAS ASSEMBLED BY STUDENTS AT THE UNIVERSIDAD
NACIONAL AUTONOMA DE MEXICO (UNAM) IN MEXICO CITY. IN ADDITION TO
PACKET STORE-AND-FORWARD OPERATION AT 1200 BITS PER SECOND, UNAMSAT
CARRIED A UNIQUE "METEOR RADAR" EXPERIMENT. (SEE JANUARY 1993 QST,
PAGE 97, FOR MORE INFORMATION ON UNAMSAT.)

REUTERS NOTED THAT THE 115-POUND GURWIN-1 TECHSAT WAS A PROTOTYPE
FOR COMMUNICATION SATELLITES AND "WAS TO HAVE BEEN USED BY AMATEUR
RADIO ENTHUSIASTS." REUTERS DID NOT MENTION UNAMSAT. TWO RUSSIAN
SATELLITES ALSO WERE LOST IN THE FAILED LAUNCH.

IN NOVEMBER 1993 THE FIRST TEST LAUNCH OF A CONVERTED SS-25 WAS
SUCCESSFUL, BUT WITH A LIGHTER PAYLOAD. RADIO AMATEURS,
PARTICULARLY IN EUROPE, HAVE HOPED THAT THE RUSSIAN ROCKETS WILL
PROVIDE AN INEXPENSIVE WAY TO LAUNCH AMATEUR RADIO SATELLITES.

Hello everyone out there in r.r.a.s!

I was wondering, (I'm fairly new to sat's -> just got a good program for the mac -> e-mail me if you want to know which one) what are the satellites that I should be watching for? I guess really what I'm asking is: Is there any sort of compiled list of the amateur sat's and freq's and/or interesting freq's to listen to and which sat's they belong to?

It's great to have Keplerian data and watch the sat go around the world, but I want to know where to uplink/downlink and what modes etc. etc.

I appreciate any pointers to FAQ's which answer my questions above, or any other helpful information (along with comments/suggestions).

TNX et 73's!

>
>Can someone give me the lowdown on what's required

I have been on Mode S for about two years now, and I much prefer it to B. Your six foot dish will work good with lots of link margin, but be forewarned that you will need pretty accurate pointing.

I am using a six footer myself, and I constructed my own 16 foot tower and az-el mount. I am a machinist/welder, so that project was not so difficult for me. I couldn't say the same for someone who doesn't have the same equipment.

The standard G5400 rotator does not have the power or bearings needed to properly turn a big dish, so you will need a heavy duty rotor. I am using a G-1000SDX for the azimuth and a TVRO screw-jack type unit for the elevation. I may write an article about it all one of these days, as the cost was not very high (compared to commercial units). I used a lot of old car parts for the bearings and drive.

As you can probably tell, there is quite a bit to getting this type of system to work. Getting it automated is yet another story!

In the end, I'm glad I went with the six footer. The signals are excellent, even out to 30 degrees plus of squint. It does take some work, though. Probably a long term project.

I use the Down East Microwave converter. It uses 144 mHz for the output, so a quick connection with a coax switch works great. Just don't transmit through it!!! I do use a pre-amp, from the same company.

For reference, signals are usually S-7 (or more if someone is using too much power) and the noise is down around S-2 to S-3. That's quite a margin!

Good luck!

From: rrm@ornews.intel.com
Message-ID: <3lmgs4$eds@ornews.intel.com>
Source record: 25500

Does anybody have the decoding information for the rs15. I've been monitoring the CW on 10m and would like to now what these packets of info mean.

The groups are sent in a set of 16 with the format following a 3-letter, 2-number group. This all begins (or ends) with thr identifier rs15.

Please Post or E-mail please the description of what these mean. I know they monitor voltages, output power, etc. Any and all comments are very much appreciated.

Thanks

Robert Miller KA7JKP

I want to obtain a copy of PCTrack (version 3.0 or later). Can anyone tell
I
me how to obtain it? Thanks for any help you can provide.

73,

Jim W0KSD

Joe -

Could you make an addition to Bulletin #11 (VE Sessions):

Sponsor: Larkfield ARC
Date: 3rd Saturday
Place: Huntington Town Hall (Jackson Ave Entrance)
Contact: Joe Coffield, W2DDZ

I don't have Joe's phone number handy, but will send it to you in a
follow-up message.

73, Ken

SB NEWS @ AMSAT $SPC0403
* SpaceNews 03-Apr-95 *

BID: $SPC0403

=========
SpaceNews
=========

MONDAY APRIL 3, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited free distribution.

* LAUNCH FAILURE *
==================
Two amateur satellites were lost when their launch vehicle exploded.
The Israeli-built GURWIN-1 Techsat and the Mexican UNAMSAT were part
of the payload of a Russian SS-25 rocket originally built to carry
ballistic missiles and recently converted to launch satellites. The
Reuters News Agency said the rocket, which was launched from
Russia's Plesetsk Cosmodrome, came down in the Russian Far East, in
the Sea of Okhotsk, on March 28.

Both satellites were designed for packet radio repeater use.
GURWIN-1 Techsat was built at the Technion-Israel Institute of
Technology in Haifa as a 9600-bit/s packet store-and-forward
satellite. UNAMSAT was assembled by students at the Universidad
Nacional Autonoma de Mexico (UNAM) in Mexico City. In addition to
packet store-and-forward operation at 1200 bits per second, UNAMSAT
carried a unique "meteor radar" experiment.

Reuters noted that the 115-pound GURWIN-1 Techsat was a prototype
for communication satellites and "was to have been used by amateur
radio enthusiasts." Reuters did not mention UNAMSAT. Two Russian
satellites also were lost in the failed launch.

In November 1993 the first test launch of a converted SS-25 was
successful, but with a lighter payload. Radio amateurs,
particularly in Europe, have hoped that the Russian rockets will
provide an inexpensive way to launch amateur radio satellites.

[Info via ARRL]

* SOFTWARE ANNOUNCEMENT *
=========================

March 31, 1995
SatTrack V3.1 has been released.

SatTrack is a satellite orbit prediction and realtime tracking program with X Window System color graphics displays. The program has been written in C language and runs on a number of different Unix and Linux systems with X11R5. It not only displays in realtime where a number of satellites are but is also capable of controlling suitable ground station equipment, like antennas or optical telescopes, and radio communications hardware. In the autotrack mode it switches between various satellites as they rise and set. Predictions of passes of satellites over specified ground stations can be run off either interactively or in batch mode.

For detailed on-line information check the new SatTrack WWW Home Page at

http://ssl.berkeley.edu/isi_www/sattrack.html

The distribution file sattrack-3.1.tar.gz (or sattrack.V3.1.tar.gz) is also available from:

ftp.amsat.org/amsat/software/Linux
ftp.jnvc.net/priv/kupiec/sattrack

[Info via Manfred Bester (manfred@ssl.berkeley.edu)]

* MIR NEWS *
============
Miles, WF1F, reports that he had a nice chat with Astronaut Norman E. Thagard on the Mir space station on 31-Mar-95. Norman is trying to get on the air as much as possible to chat with people, but there are a lot of stations calling him out of turn. This is causing lots of interference. Miles suggests that stations wanting to talk with Norman should wait until he is done talking to the specific station after which he will make the announcement "CQ". Astronaut Norman is not a "Contester". He likes to chat with each station for a 3 to 5 minutes before going on to the next station. Please respect his chosen QSO format.

Norman said the Russian crew is not keeping any type of call log, but if you talk with Norman, he is keeping a log and will try to send you a response card. Note, however, that he will not be sending cards until after he returns to earth with his log book.

Norman Thagard's QSL address is as follows:

NASA
Lyndon B. Johnson Space Center
Norman E. Thagard
Mail code CB
Houston, Texas 77058

The Mir PMS packet station is working again, but some of the TNC parameters are incorrectly set. One of the bad parameters is the TX-Delay. This is preventing most stations from reliably connecting, unless conditions are ideal. Dave Larsen N6JLH, is currently working with Norman Thagard to fine

tune the PMS parameters. It is requested that stations not try to access
the PMS Packet until all of the parameters on the Mir PMS have been properly
adjusted. The work should be completed by April 7th.

Sorry to hear that you got stuck with a MAC!
Oh well, I guess you will just have to try and make the best of it.

A Good places to find the information you are looking for (sat's and there
frequencies) is the following FTP site:

ftp.cs.buffalo.edu

The file to look for is "faq_satellite" which is found in the "ham-radio"
sub-directory within the "pub" directory.

The following FTP site also has allot of information plus software (even for
a MAC, in addition to others)
ftp.amsat.org

Useful WWW sites are:

http://www.acs.oakland.edu/barc/arrl.html

http://www.amsat.org/amsat/AmsatHome.html

>to know the proper way one is filled out.

QSL'ng Robot QSO's

Make a remark on the QSL card like: QSO-Nr.: <QSO-Number>
The QSO-Number is the number which the robot has given to you at the end
of your QSO. The callsign is the name of the satellite: RS10, RS12, RS15.
Send the QSL-card to the Radio Sport Federation, Box 88, Moscow, Russia or
via the (ARRL-) Bureau. Up- and Downlink frequencies .. see below.

>I had made a qso with another station would I say W1XYZ@RS-12, W!XYZ on
>RS-12? For the frequency do I use just the uplink, or uplink and
>downlink? Does anyone print qsl cards specifically for satellite qsos?
>TNX ES 73, Rog N6GL

QSL'ng QSO's with real HAM's, hi.

1. Make a remark on the QSL-card like: via <Satellite>
(i.e.: "via RS-10/11", or "via RS-12/13" or "via RS-15")
2. Note **both** frequencies (Uplink and Downlink) on your card.
For RS-10/11 and RS-15: Up: 145MHz, Down 29MHz.
For RS-12/13: Up: 21MHz, Down: 29MHz.
I am pretty sure you don't have special boxes/fields on your QSL-card
for the uplink and downlink frequencies, so note it in this way:

```
------+---------+----
| QRG/MHz |
------+---------+----
| 145 | write the uplink in the upper half of the box.
| ----- | make a little line in the middle
| 29 | write the downlink in the lower part of the box.
------+---------+----
```

And last not least: Think about a re-design of your next QSL-card, hi.
Think about fields/boxes: "via Satellite". "Uplink" and "Downlink".

Have fun via the RS's ..

Sattrack runs on unix boxes primarily, where there's a program called
'tar' (Tape ARchive) that is similar to a no-compression zip. It just
groups files together into one big file for ease of handling. There's
a GNU tar for PC's on prep.ai.mit.edu (I think) that is either an .exe
file or can be compiled into one. I don't know if Sattrack can be compiled
with Borland C or Microsoft C.

(A new Mac tracking program? Do tell...)

If you haven't already found it, you can get all kinds of information
on amateur radio satellites from:

ftp.amsat.org

or

http://www.amsat.org/amsat/AmsatHome.html

If you have HF receive capability, try listening for RS-10 and RS-15
on 10 meters. You'll hear the CW beacons, and CW and SSB
conversations. Look for beacons around 29.35 MHz, and downlink
activity from 29.35 to 29.40 MHz. You can hear RS-12's downlink and
beacons on similar frequencies, but unlike RS-10 and RS-15's 2m Mode A
uplinks, RS-12 uses Mode K, with an uplink on 15m.

If you have 2m receive capability you can hear various low-orbit
satellites (is Dove back on the air?). Tune down to 136 MHz and you
can hear weather satellites.

I hear weather satellites (albeit not very well) on a Realistic Pro-43
scanner, and receive RS-10 and RS-15 with an FRG-7 hooked up to some
wire strung in the trees, so you do *not* need advanced equipment to
get started.

Buy/beg/borrow/steal a copy of the Satellite Experimenter's Handbook.
Join AMSAT (who publish a wealth of introductory material). Have fun.

73 from Burnaby,
laura VE7LDH

|>>Hi Darryl,
|>>
|>>Sure, I'm using a Yaesu FT-726R, a Mirage B1016 amp, 50' of heliax,
|>>GAsFET preamp, and the KLM 14 element crossed yagi. It is the same
|>>system I use for the OSCARs such as AO-13, AO-13, FO-20, and several of
|>>the PACSATs.
|>
|>
|>I think I discovered part of the reason for your success; it's the heliax,
|>right? |-)

That's correct. The heliax twists the signal around so that it bends
over the horizon better. ;-)

N9MWB Ridge Elementary School Radio Club. See you on 160-1296 and OSCAR.

725. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-04-04 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.796958751@eel>
Source record: 25375

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293

726. Two-Line Orbital Element Sets (TLE578)

Newsgroup: rec.radio.amateur.space
Date: 1995-04-04 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.796958865@eel>
Source record: 25376

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

727. Re: Phase IIID freqs and mode ?

Newsgroup: rec.radio.amateur.space
Date: 1995-04-04 00:00:00 UTC
From: Bob Winingham <kc5ejk@onramp.net>
Message-ID: <3lqje7$7sp@news.onramp.net>
Source record: 25377

The selected Phase 3D frequencies are as follows:

UPLINKS

BAND	DIGITAL (MHZ)	ANALOG (MHZ)	CENTER (MHz)
15M	N/A	21.210 - 21.250	21.230
2M	145.800 - 145.840	145.840 - 145.990	145.915
70CM	435.300 - 435.550	435.550 - 435.800	435.675
23CM(1)	1269.000 - 1269.250	1269.250 - 1269.500	1269.375
23CM(2)	1268.075 - 1268.325	1268.325 - 1268.575	1268.450
13CM(1)	2400.100 - 2400.350	2400.350 - 2400.600	2400.475
13CM(2)	2446.200 - 2446.450	2446.450 - 2446.700	2446.575
6CM	5668.350 - 5668.550	5668.550 - 5668.800	5668.675

DOWNLINKS

BAND	DIGITAL (MHz)	ANALOG (MHz)	CENTER (MHz)
10M	29.330 MHz +/-5 KHz (To be used for digitized voice bulletins)		
2M	145.955 - 145.990	145.805 - 145.955	145.880
70CM	435.900 - 436.200	435.475 - 435.725	435.600
13CM	2400.650 - 2400.950	2400.225 - 2400.475	2400.350
3CM	10451.450 -10451.750	10451.025 -10451.275	10451.150
1.5CM	24048.450 -24048.750	24048.025 -24048.275	24048.150

All downlink passbands are inverted from the uplink passbands.

BEACONS:

BAND	Beacon-1	Beacon-2
2M	N/A	N/A
70CM	435.450	435.850
13CM	2400.200	2400.600
3CM	10451.000	10451.400
1.5CM	24048.000	24048.400

Note: The absence of a 2M beacon is due to strictly to characteristics of the IF matrix and the limited bandwidth available on that band. Studies are underway with the intent of providing a 2M beacon but it is not clear, at this time, that this effort will be successful. The beacons on the other bands are for various purposes including providing spacecraft engineering data to the command stations. All beacons can be modulated with 400 bits per second BPSK and possibly other formats.

728. Sat. Freq. Help!

Newsgroup: rec.radio.amateur.space
Date: 1995-04-04 00:00:00 UTC
From: QXBJ74A@prodigy.com
Message-ID: <3lrvi6$k2k@usenetp1.news.prodigy.com>

It is available at:
oak.oakland.edu in SimTel/msdos/satelite as
pctrk304.zip (564592 bytes)
or

via WWW it is in:
http://www.acs.oakland.edu/oak/SimTel/msdos/satelite.html

or

you can get it directly from me (I'm the author).

I also have some other satellite tracking and analysis
software available (The Satellite Visualization Tool and the Satellite
Prediction Tool).

Email me at 71371.1257@compuserve.com for details.

<reposted from sci.geo.satellite-nav>
From: ranecurl@engin.umich.edu (Rane Curl)
Newsgroups: sci.geo.satellite-nav
Subject: Garmin 40 power/data cable - homemade.
Date: 2 Apr 1995 20:23:22 GMT
Organization: University of Michigan Engineering, Ann Arbor

I have made a power/data connector for a Garmin 40 as follows:

1. Removed sockets from RS-274-001 4-pin mike connectors and drilled
out holes (1/8"). Drilled 5/64" hole for center post. Wrapped
connector body with two turns of tape for snug fit into GPS, and
cut out tape at key location.

2. Soldered D-Sub socket pins on cable wires (could have crimped).
Slipped heat-shrink tubing on socket pins, inserted them in connector
body and "fixed" in place with pieces of same heat-shrink tubing
pushed in from end to press socket pins outward (bolt-circle of
Garmin pins is larger than that of RS-274-001 holes).

3. Inserted connector into Garmin body and pushed socket-pins down onto
Garmin pins. Applied epoxy resin (ca. 2 drops) to each visible end of
socket pins (too much could run too far down and ooze out end).

After epoxy set, tightened cable clamp to cable. New connector fits
snugly into socket in GPS and good electrical connection is made.

I plan on interfacing to a Mac Powerbook. The Powerbook power supply
adapter provides 7.8 volts max, which is OK for use with Garmin 40. I plan
on making a power/data junction box out of a sacrificed LocalTalk
connector box and its MiniDIN-8 connector. For operation from 12 volts,
either a Powerbook Auto DC-DC adapter can be used (when using the
computer), or just a regulated DC-DC 6-volt auto adapter, like the
RS-270-1560 or RS-270-1563.

I observed that with the 7.8 volt (Powerbook) power supply the Garmin-40 Test window (brought up by turning on with Enter depressed) showed 5.9 volt power, so there is an internal regulator.

I'd like to acknowledge suggestions from riecksra and mellerso, which helped me make my design.

731. Doppler Freq Control - DSP2232/TrackBox/FT736

Newsgroup: rec.radio.amateur.space
Date: 1995-04-04 00:00:00 UTC
From: randyh@gvgadg.gvg.tek.com
Message-ID: <3ls7br$ngk@gv-gate.gvg.tek.com>
Source record: 25381

I am in the process of interfacing my DSP-2232 /
TAPR TrackBox / FT-736 for use on the digital satellites.

What is the best way to control the frequency of the FT-736
to correct for doppler, for both the 1200 & 9600 baud
satellites?

I know that the DSP can output mic up/down control. The
TrackBox can use serial and/or mic up/down control. Just
wondering what others have found to work the best.

Hi people-on-satellites-via-ham radio! I have never before been really interested in the hamsats, but think I would like to try the one(s) on 10 & 12m. I think this is Oscar 11/12 (or 10/11?). Can someone kindly tell me:

(1) Is there a good reference for a newcomer, especially with regard to operation on these particular bird(s) (there are some good libraries close by :-),

and

(2) what is a good program to use for telling me when the passes over my location occur? (I know I can get keps from ARRL server and I have a computer, but it's an old PC-XT/8088, running DOS 3.1).

Oh yea, also,

(3) is there any good reference for using the keps, interpreting them into the usable-information form? (Guess you can tell I haven't gotten my "feet wet" yet ;-)

Tally-ho!

I remember that mode B transponder fault but mode S transponder was OK. Realy
I don't know if it's active. (ARSENE was assigned A024).

Sorry to hear that you got stuck with a MAC!
Oh well, I guess you will just have to try and make the best of it.

A Good places to find the information you are looking for (sat's and there
frequencies) is the following FTP site:

ftp.cs.buffalo.edu

The file to look for is "faq_satellite" which is found in the "ham-radio"
sub-directory within the "pub" directory.

The following FTP site also has allot of information plus software (even for
a MAC, in addition to others)
ftp.amsat.org

Useful WWW sites are:

http://www.acs.oakland.edu/barc/arrl.html

http://www.amsat.org/amsat/AmsatHome.html

(A new Mac tracking program? Do tell...)

If you haven't already found it, you can get all kinds of information
on amateur radio satellites from:

ftp.amsat.org

or

http://www.amsat.org/amsat/AmsatHome.html

If you have HF receive capability, try listening for RS-10 and RS-15
on 10 meters. You'll hear the CW beacons, and CW and SSB
conversations. Look for beacons around 29.35 MHz, and downlink
activity from 29.35 to 29.40 MHz. You can hear RS-12's downlink and
beacons on similar frequencies, but unlike RS-10 and RS-15's 2m Mode A
uplinks, RS-12 uses Mode K, with an uplink on 15m.

If you have 2m receive capability you can hear various low-orbit
satellites (is Dove back on the air?). Tune down to 136 MHz and you
can hear weather satellites.

I hear weather satellites (albeit not very well) on a Realistic Pro-43
scanner, and receive RS-10 and RS-15 with an FRG-7 hooked up to some
wire strung in the trees, so you do *not* need advanced equipment to
get started.

Buy/beg/borrow/steal a copy of the Satellite Experimenter's Handbook.
Join AMSAT (who publish a wealth of introductory material). Have fun.

743. Poem Called SPACE...

Newsgroup: rec.radio.amateur.space
Date: 1995-04-05 00:00:00 UTC
From: swt@aloha.net
Message-ID: <3luu6v$n98@nuhou.aloha.net>
Source record: 25393

The SAREX Program inspired me to write this poem. It was after a VERY successful mission and the kids where just going crazy on campus, telling there parents that they talked to the space shuttle.
Lots of press coverage did not hold a cnadle to the energy that the kids had.... Hopefully we can keep this
energy going !!!!

Enjoy !

SPACE...

In the travels of my life, I have enjoyed walking the quiet
sands of Time, and seeing the beauty of crystal clear water
as it slowly builds to a wave,then to a horizon,
then to a world of oceans.....

I have heard the sounds of Canadian geese as they
navigate to the warmer regions of our world flying only by
instinct and god's gift of flight....

I have spoken in quiet words to those that could not speak,
and I have listened to their sounds, that only the soul can
hear...

But I have never seen a sight like that of a child's face
when the only sounds are stars from the distance galaxies above
and the glowing of planets smiling down on earth...

Alas, I have found a way in my life to show others
the vision of what I see.... and to help them hear those
sounds that only the mind can understand....

I have had the chance to see this child look into the
vast depths of space and ask only one thing......

Can you teach me ?

12-JULY-1993

An inspiration to us all, this vision of a child
as they look into the heavens.May we never forget
that teaching is in fact the extension of the spirit
to go beyond that which do not understand .....

Steve W. Teegarden

744. ARLS005 SAREX frequency changes

Newsgroup: rec.radio.amateur.space

SB SPACE @ ARL $ARLS005
ARLS005 SAREX frequency changes

ZCZC AS84
QST de W1AW
Space Bulletin 005 ARLS005
From ARRL Headquarters
Newington, CT April 5, 1995
To all radio amateurs

SB SPACE ARL ARLS005
ARLS005 SAREX frequency changes

Space Shuttle flight STS-71, to be launched in June, is the first to feature a docking between the Shuttle and the Russian Mir space station. Special Shuttle Amateur Radio EXperiment (SAREX) voice frequencies will be used.

The special frequencies are: Downlink: 145.84 MHz worldwide; and Uplinks: 144.45 and 144.47 MHz worldwide .

SAREX and Mir Amateur Radio stations normally share the same downlink frequency, which would cause interference on the STS-71 mission. Because of this and lessons learned from using particular frequencies during previous SAREX missions, the SAREX Working Group has made these changes for STS-71. The new frequencies were chosen after much deliberation to minimize interference between SAREX, Mir, and terrestrial stations.

Most SAREX operations are split frequency, with a downlink (astronauts transmitting to Earth stations) and an uplink (Earth stations transmitting to astronauts). Listen to the downlink and transmit only when the shuttle is in range and astronauts are on the air.

Mir operations are simplex and remain on 145.55 MHz.

Before transmitting, listen to the SAREX uplink to avoid interfering with others, and listen for the astronauts' instructions about frequencies they're using. They won't favor a specific uplink, and your ability to work them will be ''the luck of the draw.''

If these special SAREX frequencies prove acceptable, they will be used for future docking missions. If you have comments, send them to AMSAT's Frank Bauer, KA3HDO, at his Callbook address, or to the ARRL Educational Activities Department.

Please note that there is a strong chance that STS-70 will fly
before STS-71; if so, STS-70 will use the regular SAREX frequencies.

P3D will NOT be a geosync. If it was only part of the world could use it. P3D will have a molinya orbit much like but hopefully better than AO-10 and AO-13. The orbit paln that I saw indicated a progression so that one day North America could contact Europe and the next NA to Asia next Asia to Europe and so on. Preliminary keps are available so you can have a look at the coverages. 73 de Jerry KC5EGG

Message-ID: <3m4c1d$h1m@newsbf02.news.aol.com>
Source record: 25404

In response to your question about satellite frequencies, two suggestions, and several questions of my own, about the Mir/Soyuz/Progress/Shuttle:
1) an issue of "Popular Communications" magazine, in the last month or two, had a two- or three-page list of satellite frequencies
2) another source of satellite frequencies I've been using is the new "Satellites Times" bimonthly magazine put out by Grove, in the column on launches

For the Mir, several questions:
1) has anyone *heard* any of the non-SAREX Mir/Soyuz/Progress frequencies mentioned in this listing or in other listings? (I've been trying off and on for the last several weeks and haven't heard any of the ones I've checked)
2) does anyone know what frequency/cies the cosmonauts use during EVAs?
3) " " " " " the Mir and Shuttle used
in their recent close approach and/or will use in the upcoming docking?
I've seen references to a "VHF" frequency in NASA news releases, etc. Is it the 143.625 voice frequency Mir has used in the past?
Thanks in advance for any help, suggestions.

I Does anyone know of any DOS based satellite tracking programs?
>
> Thanks, Tom Kreyche KG6YJ

Tom use Insta Track avail from amsat.org

it is dos and basically the standard for the rest.

763. Balloon Launch Postponed

Newsgroup: rec.radio.amateur.space
Date: 1995-04-09 00:00:00 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3m7qc8$n1i@news.doit.wisc.edu>
Source record: 25263

The April 8 flight of the BARS-1 ham balloon was scrubbed due to weather.

The Badger Amateur Radio Society and the High Altitude Radio Project
announce the new date for the launch of the BARS 1 Weather Balloon

Launch Date: Saturday, April 15, 1995 (Rain dates: early May)
Launch Time: 9:00 - 10:00 AM CDT (14:00 - 15:00 UT)
Launch Site: Hillsboro, Wisconsin (About 20 miles W. of Wisconsin Dells)

ATV transmit freq: 439.25 3 watts Color
GPS/APRS Packet TX: 441.05 2 watts 1200 baud packet
Cross-Band Repeater Output: 439.25 3 watts FM (Same as ATV output)
Cross-Band Repeater Input: 144.325 Vertical polarization
Expected Radio Range: 270-380 mile radius from balloon's location

Note that the crossband repeater output and the ATV transmitter are on the
same frequency. The ATV transmitter's carrier is FM Modulated with the
voice signal. The voice and TV signals don't interfere with each other.

This flight will be BARS' entry in the 1995 University of Wisconsin
Engineering Expo, a bi-annual display of student engineering prowess that
is scheduled for April 21-23 on the University of Wisconsin, Madison campus.
The payload and video tapes of the flight will be displayed at the expo.

The launch will be announced on the Baraboo 146.88 repeater. Chase crew
coordination will be on the balloon's cross band repeater.

For info: N9LTD@WD9ESU.EN53IE.WI.USA.NOAM or djmullen@facstaff.wisc.edu

764. OS/2 Sat tracker under dev.

Newsgroup: rec.radio.amateur.space
Date: 1995-04-09 00:00:00 UTC
From: anilsson@yarrow.wt.uwa.edu.au
Message-ID: <3m8k4c$aeb@styx.uwa.edu.au>
Source record: 25264

Hi All,

I am currently writing a native OS/2 satellite tracker and would like some feedback on what people would like in it.(assuming anyone here uses os/2) Just send me a piece of email with a list a features you would like and/or any comments. I am mostly interested in the user interface and the way the windows are arranged.

Andrew Nilsson, VK6JBL
anilsson@yarrow.wt.com.au

765. Re: OS/2 Sat tracker under dev.

Newsgroup: rec.radio.amateur.space
Date: 1995-04-09 00:00:00 UTC
From: kamer@ibm.net
Message-ID: <3m8sea$1ncj@news-s01.ny.us.ibm.net>
Source record: 25265

Very interested that you are considering working on a satellite tracking program under OS/2. Here in Illinois I and a group of people are dedicated to OS/2 as an OS. As I ham I would welcome further development in this area and would be happy to collaborate on any programming efforts.

I find that STSPLUS offers a great deal of what I am looking for in a satellite tracking program, but would like to see multiple satellite tracking (e.g. multiple windows to track individual birds). If emphasis is on packet, WISP seems to have it all, except for better scalability on the graphics maps.

Am interested in your progress, and would be happly to supply detailed information on a wish list.

766. Two-Line Orbital Element Sets (TLE582)

Newsgroup: rec.radio.amateur.space
Date: 1995-04-09 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.797428798@eel>
Source record: 25266

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

>than getting all sats alltogether).
>

I tried responding to your earlier query about this by email, but the
message bounced. Anyway, try ftp to
kilroy.jpl.nasa.gov/pub/space/elements/satelem.

The files there are weekly updates of about half the NORAD catalogue,
and should include just about all geosynchronous satellites, dead and
alive, except for classified ones.

Hi,

I am the one the wrote the Kansas City Tracker Driver for Windows and
WiSP. If you are interested in KCT/T or other tracker support, please
drop me a note to:

dhoatson@aol.com
or
kc6wyg@amsat.org

Hi All

I'm looking for a single TRAKBOX PCB either unpopulated, part built or
kit

Please email me if you have one you wish to part with.

Subject: PacComm Sprint-2 with WISP?

If anyone out there has any experience with the PacComm Spint-2 TNC
I would like to get some feedback on how well it performs. I am also
interested in hearing from anyone that has interfaced one of these
with WISP.

Thanks.....

My recent experience shows that the 145.980 uplink channel on KO-25 is not
functional at this time .... anyone else out there that can confirm this?

That is correct. The 145.870 is the only one active now.

: now, just to make sure...
: 3d will be a geosync sat? so a yagi pointed in one place is good enough?

The satellite will return to the same spot in the sky every two days.
For some purposes fixed yagis will be adequate.

: and as above....alalog...will that be such as SSB/FM/CW??

The linear transponder is for SSB/CW. FM doesn't allow to
satellite to efficiently handle a large user base simultaneously as
with SSB/CW. There will also be digital operations, but uplink/downlink
requirements won't be much easier than with existing satellites.

was wondering... now that design and possibly construction has to be underway, does anyone know what data rate P3D will handle digital data on? I assume 9.6K but I have heard PacComm has a defacto standard of 38.4K for the new SPRINT-2(SPIRIT-2) TNC and I have heard other data rates are being tossed around... since there aren't any radios (off the shelf) that can handle these data rates it would be good to start working on a receive system early... receiver modification is highly dependent upon data rate --so thats why I am interested in the final data rates ...

Rudak-U will be very flexible with a DSP and other modems. The two most mentioned speeds are 56k and 256k. This will take some time to settle out after launch, so there's no rush right now. Considering what it takes to get any one working, I think it would be best to wait until it is launched and some testing is done to see what will actually work best.

> I assume 9.6K but I have heard PacComm has a defacto standard of 38.4K for the new
>SPRINT-2(SPIRIT-2) TNC

If they think this is a standard, they should think again. 56k is far more prevelant.

SB NEWS @ AMSAT $SPC0410
* SpaceNews 10-Apr-95 *

BID: $SPC0410

=========
SpaceNews
=========

MONDAY APRIL 10, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* LAUNCH FAILURE UPDATE *
========================
Following information comes from Richard Limebear, G3RWL. Anyone repeating this story is requested to acknowledge AMSAT-UK as the collator of the information:

Further information about the launch failure is now to hand. Apparently the failure was because the fourth stage did not burn completely so the fifth stage was not triggered; the fourth stage quenched 12 seconds before it was supposed to be exhausted. It is also understood that the debris fell on land, not in the sea, and the landing site is known but if salvage is attempted the components will not be re-usable (not surprising after falling about 600 km! do satellites get headaches ?).

Russian authorities are still claiming that UNAMSAT (the so-called Mexican spacecraft) was a Russian satellite which had Mexican participation; details of this are vague and further verification of ownership would be welcome from anyone who *KNOWS*.

The third payload *WAS* a dummy; I have seen the photographs, it was a plain cylinder.

Launch was from a (fixed) mobile launcher tube which, apparently, erects hydraulically from horizontal to vertical in about 13 seconds; the launch vehicle is then lifted vertically in some fashion before main motor ignition.

The Israelis are, I understand, already building two more Techsat-1 class spacecraft; more or less copies of the first one. There is no indication of a replacement launch but it is notable that Russian officials are now saying that there was no clause for financial compensation in the launch agreement. At the launch-site, however, Israeli staff were told by Russians that another

launch would be provided.

This information is a collation of data from 4X1AS (still in London), Geoff Perry, and Reuters whom we thank.

[Info via Richard, G3RWL for AMSAT-UK and UOSAT]

* SAREX QSY *
==========
Space Shuttle Flight STS-71, to be launched in June, is the first to feature a docking between the shuttle and the Russian MIR space station. Special Shuttle Amateur Radio Experiment (SAREX) voice frequencies will be used.

The special frequencies are: downlink: 145.84 MHz worldwide and uplinks: 144.45 and 144.47 MHz worldwide.

SAREX and MIR amateur radio stations normally share the same downlink frequency, which would cause interference on the STS-71 mission. Because of this and lessons learned from using particular frequencies during previous SAREX missions, the SAREX Working Group has made these changes for STS-71. The new frequencies were chosen after much deliberation to minimize interference between SAREX, MIR, and terrestrial stations.

Most SAREX operations are split frequency, with a downlink (astronauts transmitting to earth stations) and an uplink (earth stations transmitting to astronauts). Listen to the downlink and transmit only when the shuttle is in range and astronauts are on the air.

MIR operations are simplex and remain on 145.55 MHz.

Before transmitting, listen to the SAREX uplink to avoid interfering with others, and listen for the astronauts' instructions about frequencies they're using. They won't favor a specific uplink, and your ability to work them will be "the luck of the draw."

If these special SAREX frequencies prove acceptable, they will be used for future docking missions. If you have comments, send them to AMSAT's Frank Bauer, KA3HDO, at his callbook address, or to the ARRL Educational Activities Department.

Please note that there is a strong chance that STS-70 will fly before STS-71 if so, STS-70 will use the regular SAREX frequencies.

[Info via ARRL]

* EME LISTSERV NEWS *
====================
"Moon-Net", a new e-mail reflector for amateur EME operators, has been established by Michael Owen (W9IP) with support of his employer, St. Lawrence University. This reflector is devoted to exchange of information regarding all aspects of EME operation. It is an unmoderated list open to anyone with an interest in EME.

"Moon-Net" traffic should adhere closely to EME-related topics. Please refrain from posting VHF, satellite, or general ham radio-related messages to "Moon-Net". Also, please avoid cross-posting messages to/from "Moon-Net" with other radio-related lists. "Moon-Net" traffic is not archived.

To subscribe, address a message to : LISTSERV@VM.StLawu.EDU. In the body of the message, put "SUBSCRIBE Moon-Net" followed by your name. For example:
SUBSCRIBE Moon-Net Michael Owen

When your request for subscription is received, a file of instructions will be sent to you along with confirmation of subscription. This should only take a few moments.

To un-subscribe, the message should be UNSUBSCRIBE (everything else is the same):
UNSUBSCRIBE Moon-Net Michael Owen

Since subscription/unsubscriptions are handled automatically, no other text will be read if the address is LISTSERV.

To post a message to the net, address it to: Moon-Net@VM.StLawu.EDU. If you have problems, send a message to MOWE@SLUMUS.STLAWU.EDU. This is the first LISTSERV at this site so users should expect a few start-up glitches. Please be patient.

[Info via Michael Owen, W9IP]

* SpaceNews BBS NEWS *

Hello there!

I know there are some satellites running 9k6 FSK downlinks on 70cm with G3RUH mode. I have some small questions:

Which satellites?

I am used to run 9k6 FSK for terrestric work. But I know that I need special software to access these sats. Is there any FTP where I can find this software?

Please, mail your answer directly to me because my access to this news-group is not so optimal.

Thanks a lot in advance

780. ICOM 275/475 Questions (Probably Stupid...)

Newsgroup: rec.radio.amateur.space
Date: 1995-04-11 00:00:00 UTC
From: jcw@kd4dts.radio.org
Message-ID: <1995Apr11.173347.10206@kd4dts.radio.org>
Source record: 25280

I have recently acquired a Icom 275 and 475, and a Kansas City Tracker board. I don't have any docs for the KCT, and as I understand it, it has no interaction with the TNC, only the rotator (I have a Kenpro 5400). In addition, as far as I can tell, the ICOMs can only step in 1Khz intervals in FM mode.

If I want to use the PacSats, do I need a different controller (like the AEA or TrakBox)? And, how to those controllers cause the radio to step in finer steps? Do they talk over the serial control port for the radio, and send the correct frequency? Or is there a mod for the ICOM that allows finer stepping?

There seems to be a severe lack of documentation out there for the satellites, as far as certain radio/TNC/antenna requirement go. I have seen articles that tell me how to aim antennas, mod radios, etc, but nothing that tells me which side band to use (upper or lower). Or proper tuning strategies. Or various radio/TNC/controller combinations. All these things seem to be passed on by word of mouth...

>anilsson@yarrow.wt.com.au

How about some kind of drag-and-drop access to select the satellite(s)
that are tracked. Something like this... I click a toolbar button or
select a menu to get a window with one icon per satellite in my
database. Just drag the icon to the main screen to include it, and drag
a satellite pointer off the screen to remove it. Sure would beat
clicking through lines and lines of lists. Give me a while to think of
other suggestions. :-)

Cheers, good luck, and thanks for doing this for OS/2
Chris Morrison KG5NK
Tulsa, OK

P.S. I guess dragging and dropping could also work to load the program
in the first place. Double-click or drag an icon for the first
satellite to track and go from there.

|>oh well, there goes the budget :)
|>is there any geosync hamsats expected soon?

Why will this impact your budget? The plan as I understand it is that the apogee point will be in roughly the same point each time it is visable. So although the bird is not geosynchronous, it would appear like a time-shared geosynchronous bird that is shared between three places.

Also as was previously pointed out, a geosynchronous bird would only cover a portion of the globe. As a result substantially fewer amateurs world wide would be likely to contribute to such an effort. Given the costs involved and the difficulty just raising the funds for P3D, it's hard to imagine any geosynchronous amateur birds in the near future or possibly ever.

You might try NASA Spacelink, http://Spacelink.msfc.nasa.gov.
Click on the astronaut picture at the beginning and search for
ham;rebroadcast;shuttle;audio. One of the hits that returned was
NASA.Projects/Human.Space.Flight/Shuttle/Shuttle.Missions/Flight.033.STS-32/
Ham.Rebroadcasts.of.Mission.Audio. That was a pretty comprehensive list.

I had to re-post this reply due to operator interface error! Sorry.

Is there a program available (freeware) that would screen out the SPAM
that we are receiving via e-mail? I get enough to shuffle through with
my business mail and the ARRL mailings that I subscribe to. The ARRL
may be the source of the problem since I haven't given out my address
to any other commercial operation. I just received three pages of information
about a ham newsletter of no interest to me. I sent them an e-mail asking
to be UNSUBSCRIBED, but doubt it will matter to them.

Source record: 25297

Andy, RK3KPK operator of the RS3A RS Command Station sent me the following information today 29th January 1995 in response to my RS-15 TLM request.

RS-15 TELEMETRY

As a rule the telemetry is sent in CW. It represents various status indicators and measurements made on the transponders. 16 data channels are sent. Each channel is in the form of 3 alpha characters followed by 2 numeric characters. For example IIR 39, the IIR part is the alpha and the 39 is the numeric part of the channel. The alpha part indicates a specific status such as U < Normal or U = Normal for the onboard power supply. In the example IIR 39, the IIR parts gives a specific status for 1 channel. The onboard power supply voltage IIR means the Voltage is Normal. If however IIR is replaced by IIW in channel 1, e.g. IIW 39, then the voltage is less than normal. The numeric part of Channel 1, 39 in our example gives the real voltage of the onboard power supply where the value in volts equals the number sent multiplied by 0.4. That is ......

Volts = n x 0.4 = 39 x 0.4 = 15.6

1. II U,K,W,O - Voltage of the onboard power supply less than normal
S,D,R,G - Voltage of the onboard power suply is normal
n x 0.4 = real voltage in volts

2. IN U,K,W,O - Sensitivity transponder rx is maximum
S,D,R,G - Sensitivity transponder rx is minimum
n/10 = TX 29 MHz output power.

3. IA U,K,W,O - Beacon-1 output is nominal
S,D,R,G - Beacon-1 output is maximum
n x 0.2 = IFA-1 power supply voltage

4. IM U,K,W,O - Beacon-2 output is nominal
S,D,R,G - Beacon-2 output is maximum
n x 0.2 = IFA-2 power supply voltage

5. NI U,K,W,O - Service info
S,D,R,G - Service info
n x 0.2 = Stabilizer +5 V (Volts)

6. NN U,K,W,O - Service info
S,D,R,G - Service info
n x 0.4 = Solar battery voltage (volts)

7. NA U,K,W,O - Service info
S,D,R,G - Service info

n x 20 = Solar battery current (mA)

8. NM U,K,W,O - Service info
S,D,R,G - Service info
n x 20 = the consumption current (mA)

9. AI U,K,W,O - TLM sampling period = 60 min
S,D,R,G - TLM sampling period = 15 min
n - 10 = 10m TX temperature in C

10. AN U,K,W,O - Transmission of TLM = 600 Baud
S,D,R,G - Transmission of TLM = 1200 Baud
n - 10 = 2m RX temperature

11. AA U,K,W,O - Transmission from board memory = 600 Baud
S,D,R,G - Transmission from board memory = 1200 Baud
n - 10 = stabilizer temperarture in C

12. AM U,K,W,O - Receiving of board memory = 600 Baud
S,D,R,G - Receiving of board memory = 1200 Baud
n - 10 = temp of charger block in C

13. MI U,K,W,O - Transmission of TLM info is ON
S,D,R,G - Transmission of TLM info is OFF
n - temp., solar battery block 1
(identified by a table)

14. MN U,K,W,O - Transmission from board memory is ON
S,D,R,G - Transmission from board memory is OFF
n - temp., solar battery block 2 in C
(identified by a table)

15. MA U,K,W,O - No use
S,D,W,O - No use
n - temp., solar battery block 3 in C
(identified by a table)

16. MM U,K,W,O - Accumulator is OFF
S,D,W,O - Accumulator is ON
n - pressure in the hermetic container
(identified by a table)

This should assist our scientific use of RS-15 and to explore some of the anomalies of variable spin fading, signal strength, etc. Note that there is no positive indication of a Mode 'K' or 'T' transponder system unless it is resident within the vectors labelled 'Service Info'

Try asking a ham radio club in your area, visit radio shack and see if
they have a list of clubs. The shuttle when running a Sarex mission
(Shuttle amateur radio experiment) uses 2 meters and the downlink is 145.550.
STS-71 will use a special downlink - 145.840. If your scanner has a way
to scan all freqs try scanning between 144.000 and 148.000. if there's a
repeater re-broadcasting near you your bound to find it. Just remember,
the shuttle transmissions are not continuous - there are sometimes LONG
delays between transmissions. If you have a shortwave radio WA3NAN
Goddard radio club rebraodcast on 3.860, 7.185,14.295, 14.285. In N.Y.
I've only heard them on the first 2 freqs. If while the shuttle is flying
over your area and you hear strange bursts of noise yuur hearing Packet
transmissions from hams and the shuttle. This is computer communication.
The shuttle usually uses 2 modes, voice and packet. The also use other
modes as well.

Message-ID: <n9rze-1504951658440001@ruger-26.slip.uiuc.edu>
Source record: 25212

I've been looking into building my own dish for S-band operation. The current rotors could not hold up a 6' dish. So I need to build a custom platform. In doing so I use a standard heavy duty rotor for the azimuth, but for the elevation I would use a screw-jack. Thing is, the screw-jack uses a reed switch to tell the controller how many rotations it has moved. But, as far as I can tell, amateur equipment uses pots to tell the controllers where they are. This is no problem, I would put a pot onto the elevation assembly. But what I don't know is, what info do the controllers get. How do they know where the rotors are pointing? Such as the AEA ST1, does it have preset memories for the various commercial rotors? Can I tell it a custom setting for my setup? As in, it ask's for me to point to 0 degrees elevation then save that resistance value, then point to 90 degrees elevation and save that too. Then the controller knows from what value to work with. Thus I've solved my delema for a custom controller. I'm interestd in any and all controllers out there, not just the AEA ST1. Thanks in advance.

Hi Danny,
You request for frequencies to monitor the shuttle:
If I knew your location, you could listen to live ground-to-air rebroadcasts from the Goddard Amateur Radio Club. I usually listen on 14295.

If you want to try and work the shuttle, they have an uplink freq of 144.45 FM (simplex) and 144.47 FM. The downlink is 145.84 FM (simplex). Note that you will need a radio capable of operating split freq. i.e. I am using a Yaesu FT-736R to communicate digitally or via voice.

MIR uses 145.55 simplex, some voice on this freq, usually they leave the packet BBS on.

Hope this helps, Dean N4TYS

815. WISP Help Needed

Newsgroup: rec.radio.amateur.space
Date: 1995-04-15 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3mq9c6$h6e@newshost.lanl.gov>
Source record: 25308
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

OK folks I give up. I need some help. I am running WISP with
a KPC-9612 trying to access the pacsats. Rig is FT-736
with the GB3RUH mod for 9600 baud. Antennas and rig are
controlled by a Kansas City Tracker card. I have optimized
the TNC for transmit with a AEA DM-1 and it is right on 3kHz
I also optimized the receive per Kantronics instructions.
The antennas point and the rig get tuned. The 9600 baud signal
breaks right through the squelch, the port 2 receive light comes
on solid, the connect light flickers. On the bottom of the status
display for msre the "T:" display racks up bytes at a great rate
but at the end of the pass I have nothing but KISS files for my efforts.
I would guess I have something set wrong but I can't figure it
out. For the first effort I am just trying to get a directory
so no joy. Any help will be greatly appreciated.
By way of my contribution I played with the mike drive on the 736
with the deviation meter in line and found no change in deviation.

>
> - John, KD4DTS (Satellite wannaba)

The AEA ST-1 uses the CI-V serial port for controlling the icoms. Here the program will tell the Icom the proper frequewncy to be on, there is no ' stepping ' per say as the radio is able to understand direct commands for frequency. many computer control programs make the radio scan by writting a new frequency to the radio each ' step ' Now some other devices rely on the actual Up / Down controls of the radio, this is easier to do.

If you want to try to work the Space Shuttle during one of their SAREX missions, the propper frequencies are.....

145.550 downlink

144.910 uplink
144.930 "
144.950 "
144.970 "
144.910 "

Those are all voice frequencies........

The packet uplink frequency is..... 144.490 MHz

I have contacted the Shuttle MANY different times, (voice) using a Ringo Ranger 2 antenna hooked to a Yeasu FT 2400.

As you can see, You don't need anything fancy, so Good luck.

STS-71 WILL USE A SPECIAL UPLINK FREQUENCY OF 144.450 & 144.470 MHz with a

*****DOWNLINK OF 145.840 MHz.*****

They will use those frequencies on that mission, due for that mission so they don't interfear (sp) with the MIR, when they are docked to it.

You might try NASA Spacelink, http://Spacelink.msfc.nasa.gov.
Click on the astronaut picture at the beginning and search for
ham;rebroadcast;shuttle;audio. One of the hits that returned was
NASA.Projects/Human.Space.Flight/Shuttle/Shuttle.Missions/Flight.033.STS-32/
Ham.Rebroadcasts.of.Mission.Audio. That was a pretty comprehensive list.

I had to re-post this reply due to operator interface error! Sorry.

Hi Paul,
About your message here for elmers, I would be willing to assist for
AMSAT related questions, I am currently an area co-ordinator for AMSAT
for NC and I work all amateur space satellites and the SAREX shuttle
missions.

I have been collecting information sources here in the I-net for
referral to other amateurs, as well as for my own info purposes.
If you feel my assistance could be of use, please advise that you
are going to refer questions to me.

You can use n4tys@amsat.org for my internet mailing address in the
event you think I would be of assistance.

824. Two-Line Orbital Element Sets (TLE587)

Newsgroup: rec.radio.amateur.space
Date: 1995-04-16 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.798056033@dolphin>
Source record: 25224

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Good idea, and be able to Drop the latest keps onto the icon to update to the latest keps rather than having to tell the thing which keps file to use.

I just checked and it IS there. I used anonymous login.

Ron

828. Question about STSPLUS Sat Tracker

Newsgroup: rec.radio.amateur.space
Date: 1995-04-16 00:00:00 UTC
From: FULLER@UWSTOUT.EDU
Message-ID: <01HPEX0AGQGY000JFF@UWSTOUT.EDU>
Source record: 25228

Trying out STSPLUS and have a question that I cannot find an answer to in the documentation.

Does anyone know what the 'highlighed data" in F3 Pass Predictions and Data Output signify. These lines always appear to be the passes with the lowest angle. Does the "highlighted data" mean more than that?

Thanks in advance!

829. Re: Question about STSPLUS Sat Tracker

Jon,
My take on it is that it's showing the LOWEST altitude passes. I know
of no other reason why it does that other than maybe it's a bug of some
sort. Maybe someone else knows or has their own idea. GREAT program!

Tom

Subject: **Shuttle Radio Communications**

>> Does anyone have a list of frequencies/repeaters to monitor the
>>Shuttle? Thanks in advance.

Use this for starters...

There have been many requests for "where do I find the audio for the Shuttle" on the forum. As mentioned earlier, the Goddard Amateur Radio Club (Greenbelt, MD) re-transmits the audio on a number of HF frequencies, and a number of Amateur Radio repeaters throughout North America also place the Shuttle audio on their output. This system is called "NASA Select Audio", and is usually pulled from a satellite feed or other direct method. This service is available on non-DoD missions. On some launches a video feed is also available, which is then made available on some ATV (Amateur Television) repeaters.

I have summarized those feeds that I know about below, I would encourage you to let me know of any additions or changes that you know about. Keep in mind the list will change as repeaters add or drop the audio. Also, the audio will be present only when there is activity, which is not constant, especially at night. At other times you will probably hear other Hams chatting.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

ftp.amsat.org

if you are using a web browser you can also try it as

ftp://ftp.amsat.org netscape does this fairly well it does seem faster if you have wsftp to work with though. I think I got the last copy of it off cica.indiana.edu using web browser.

use ftp to archive.afit.af.mil

then pub\space look for files with *.tle like amateur.tle, mir.tle,
weather.tle.

tle.new has all of the satellites in it.

gl and 73,
Jim

If you don't want your '7100 hacked up, there's an external IF module that you can purchase called the Swagursat. It plugs into the IF output on the back of the '7100 and provides a 30 - 40 kHz bandwidth for APT reception. I have one, and it works okay (not great, but certainly better than without it). The only problem is that for what you get, it's pretty expensive. All it is comprised of is a metal chassis box and essentially a receiver strip from the 10.7 MHz IF back to the speaker.

Or if you're looking for an experiment with one of those IF's-on-a-chip IC's, this would be a good one.

It would (unfortunately) seem to apply here as well. Unfortunate, because the SAREX rebroadcast has intrested many a good amateur into the hobby.

841. FS: Myers new style S-band dish

Newsgroup: rec.radio.amateur.space
Date: 1995-04-17 00:00:00 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <D76zHy.1J8@murdoch.acc.Virginia.EDU>
Source record: 25241

I realize this isn't rec.radio.swap but the following rather specialized item is likely to get "lost" in the 100's of entries on that bulletin board.

I have a brand new (never rained on) Myers new style 2 part cast magnesium S-band dish. The dish works very well and I have used it with an SSB downconverter for both CW and SSB contacts on AO-13 before the orientation was altered last month. Only reason to sell is that, being a "tinkerer" I've built a slightly larger dish (with minimal signal improvment) and I don't need both. This will be a great setup for the Mode-S downlink on P3D.

New dish costs $56 plus $12 for shipping and handling. I'll sell this one for $50.00 and I'll pay the shipping anywhere in the continental U.S.

Please E-mail direct to:
sem2r@galen.med.virginia.edu

* FUTURE AMERICAN VISITORS ON MIR *
==========
Astronaut Shannon W. Lucid, Ph.D., will be the second American to be a prime crew member during a five-month stay aboard Russia's space station Mir in 1996. Jerry M. Linenger (Commander, Medical Corps, USN) will be the third American to fly to the orbital laboratory, also in 1996.

John E. Blaha (Colonel, USAF, Ret.) will serve as backup to Lucid and Scott E. Parazynski will act as backup to Linenger. Lucid and Blaha have been training since February in Star City, Russia. Linenger and Parazynski will begin training at the Gagarin Cosmonaut Training Center in late May. Blaha and Parazynski will continue training at Star City for stays aboard Mir on future missions.

These assignments continue the U.S./Russia human space flight cooperation, which consists of a three-phased program.

Phase one includes seven planned Space Shuttle-Mir missions between 1995 and 1997, including rendezvous, docking and crew transfers. The Space Shuttle will assist with crew exchange, resupply and payload activities for Mir. Russian cosmonauts have flown on two Shuttle Missions - STS-60 in 1994 and STS-63 last month. Four or more U.S. astronaut stays aboard Mir are planned, totaling nearly two years of on-orbit time.

Phase two is the joint development of the core international Space Station. Phase three is the expansion of the Space Station to include all of the international partners.

Lucid, 52, has flown four times aboard the Shuttle. She was a mission specialist on STS-51-G in June 1985, STS- 34 in October 1989, STS-43 in August 1991 and STS-58 in October 1993. She received her master of science and doctorate of philosophy degrees in biochemistry from the

University of Oklahoma in 1970 and 1973 respectively.

Blaha, 52, has flown on four Shuttle missions, STS-29 in March 1989, STS-33 in November 1989, STS-43 in August 1991 and STS-58 in October 1993. He received a master of science degree in astronautical engineering from Purdue University in 1966.

Linenger, 40, flew on Discovery's STS-64 mission in September 1994. He earned a doctorate in medicine from Wayne State University in 1981 and a master of public health degree in health policy and a doctor of philosophy degree in epidemiology from the University of North Carolina in 1989.

Parazynski, 33, was a member of Atlantis' STS-66 crew in November 1994. He completed medical school at Stanford University in 1989 and served his medical internship at the Brigham and Women's Hospital of Harvard Medical School in 1990.

* RS-15 DX NEWS *
==========
James Tudehope, KL7QR, of Valdez, Alaska reported contacting Cyo, JA0BBW, in Japan via RS-15 using CW from 05:16 GMT to 05:25 GMT on 14-Apr-95. James uses 100 watts of transmitter power into a ground plane on 2 meters for his uplink to the satellite. His downlink antenna consists of a dipole strung between trees.

KL7QR was also able to contact Steve, VE3TFU, near Toronto, Canada on RS-15 using SSB. He received a 5x5 signal report. James perfers to operate CW on RS-15 because he seems to get more use of the satellite from horizon to horizon, as opposed to operating SSB where he has a narrower window of good copy. James can usually be found on a downlink frequency of 29.375 MHz on both RS-15 and RS-10 satellites.

* THREAT TO HAM BULLETINS *
==========
A petition for rule making before the FCC would eliminate all one-way transmissions such as code practice and information bulletins on the amateur bands below 30 MHz.

The FCC has assigned file number RM-8626 to the petition, which was filed by Frederick O. Maia, W5YI, publisher of the commercial newsletter "The W5YI Report". The petition seeks to eliminate the rules that permit one-way information bulletins and Morse code practice in the amateur bands below 30 MHz. The effect of the petition would be to silence W1AW bulletin and code practice transmissions, among others.

Maia calls the FCC rule that permits certain one-way transmissions on the amateur bands "a very permissive category and taken in its broadest context, permits just about anything to be transmitted that is even remotely associated with the amateur service."

Maia says that code practice is now available on computer software, and information bulletins about amateur radio can be had on various computer on-line services.

Comments on the petition may be sent in the form of a letter to the Secretary, FCC, Washington, DC 20554. The file number, RM-8626, should be shown prominently at the top. An original and five copies is preferred, but single copy comments will be accepted.

A copy should also be sent to Mr. Maia's lawyer, Raymond A. Kowalski, Keller and Heckman, 1001 G Street NW, Washington, DC 20001. The deadline for comments on the petition is May 4, 1995.

>but at the end of the pass I have nothing but KISS files for my
efforts.

Gerald, it sounds like the TNC is doing fine (at least receiving), "T:"
will only increment on valid KISS packets from the TNC. The "F:" and
"D:" boxes should be incrementing also. If "D:" is incrementing on you
can't call up the directory with ViewDir, you may want to check your
subdirectory assignments for each satellite.

BTW, you can turn off the KISS file option (it just clutters up the HD).

>I would guess I have something set wrong but I can't figure it
>out. For the first effort I am just trying to get a directory
>so no joy. Any help will be greatly appreciated.
>By way of my contribution I played with the mike drive on the 736
>with the deviation meter in line and found no change in deviation.

Maximize the mspe window, so that you can view everything coming from
bird and try sending some manual fill requests (directory or file,
doesn't
matter) to see if the bird responds. If no OK's or NO-1's, then you're
not
making it. You may want to look at your 736 mod to the varactor or your
cable from the TNC to the radio.

Just some ideas, hope they help.

Roland, I think W5YI is more interested in the CW practice bullitens coming from W1AW because it cuts into his business of selling code practice tapes and software... Maybe I'm reading it wrong, but it sure seems like it's for less than altruistic reasons! But I would agree that it does seem to be fuzzy in that area. I believe his lawyer is fielding questions on these issues... saw the name and number in one of the recent Space News bullitens.

850. Re: WISP Help Needed

Newsgroup: rec.radio.amateur.space
Date: 1995-04-19 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3n3bpc$5k8@newshost.lanl.gov>
Source record: 25250
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Ken and all who offered help,

It is running now. The problem was with the KPC-9612. WISP
needs to be able to access the extended KISS instruction set
and use port2 apparently the 9612 defaults to port1.
What I learned is there are a couple of things that have to be
done form another terminal program before MSPE runs.

The TNC interface has to be in terminal for you to be able
to access these commands. If they won't work type "int term"
from the cmd: prompt. The TNC setup commands are:
maxusers 0/1 ;this locks TNC to port2
mydrop 1/0 ;this allows the extended KISS command set on port2

When this is done get out of your terminal program and start WISP as usual.

:note the maxusers may not be necessary I will experiment and
report. With the new WISP you can do this from within the program
I expect to get this done this weekend and will post instructions
Monday.

73 de Jerry finally on the birds.

852. RFD: rec.radio.amateur.low-profile

Newsgroup: rec.radio.amateur.space
Date: 1995-04-20 00:00:00 UTC
From: adam@libertynet.org
Message-ID: <3n6bvc$mc9@rodan.UU.NET>
Source record: 25252
Cross-posted to: news.announce.newgroups,news.groups,rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.amateur.policy

```
REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.radio.amateur.low-profile

Group Name: rec.radio.amateur.low-profile
Proponent: Adam O'Donnell <adam@libertynet.org>
Distribution: worldwide
Newsgroups file: Operation of low-profile amateur radio stations.

This is a formal Request For Discussion on the creation of an unmoderated
Usenet newsgroup, rec.radio.amateur.low-profile.

This RFD has been posted in accordance with the Guidelines for Newsgroup
Creation. Its language is based on previously submitted RFDs.

**********************************************************************

NOTE: This is not a Call for Votes (CFV). Do not try to vote now.

This message begins a discussion period considering the creation of a
rec.radio.amateur.low-profile newsgroup. Discussion should take place in
news.groups. All follow-up posts should be made to news.groups.

Any comments such as "I vote yes for rec.radio.amateur.low-profile" will
be treated only as a positive reaction to the proposed charter and not
as a yes vote on the creation of the group. The CFV will contain
instructions on how to vote.

**********************************************************************

CHARTER:

Rec.Radio.Amateur.Low-Profile is a newsgroup devoted to those
amateurs who, for various reasons, must configure their radio stations
to operate from restrictive areas such as condos, apartments, townhouses,
neighborhoods with outdoor antenna restrictions, ships/boats, mobile
homes,
or wherever they fry their burgers and call home.

The objective of this newsgroup is to encourage us to investigate
means of employing all of the modes available to us for as many different
purposes as possible. For examples, how can we use: FM (frequency
modulation), CW (morse code),
SSB (Single Side Band: Voice on the Short Wave bands) on: LongWave,
ShortWave, VHF (Very High Frequency), UHF (Ultra High Frequency),
MicroWave, and Satellite.
```

Operators who use the newsgroup will be encouraged to describe in
detail their home station and how they solved the never-ending problem of
small city lots and housing development "no-antenna" contracts.

Rec.Radio.Amateur.Low-Profile will be an unmoderated newsgroup.
Users of the group are already experienced netiquette because of their
experience in Amateur Radio, which is a sort of Ladies/Gentleman's club.

A Rec.Radio.Amateur.Low-Profile FAQ will be posted a few weeks after the
creation of the newsgroup.

REASONING:

There are many newsgroups and mailing lists that exist on the
Internet for amateur radio antennas, low power operation, satellite
communications, etc. where operators in restrictive conditions post
continually post messages for help with their situation. In more cases
than not, the operator cannot find sufficient help on the 'group or list.

There should be a place where people who have solved their problems
with cramped quarters can post their problems to a group of knowledgable
amateurs.

I have conducted several informal polls and have discovered
that there are many amateurs (and, actually, non-amateurs) who would
very much favor and enjoy the creation of a newsgroup of this sort.

Distribution of RFD:

The complete official messages - RFD, CFV and vote results
will be posted to these required or affected newsgroups:
news.announce.newgroups, news.groups
rec.radio.amateur.antenna, rec.radio.amateur.misc,
rec.radio.amateur.homebrew, rec.radio.amateur.equiptment,
rec.radio.amateur.space, rec.radio.amateur.policy

Procedure for creating this newsgroup:

Interested parties are encouraged to comment on this proposal in
news.groups. Please post your comments *only* in news.groups.

After 21 days, if there appears to be a strong consensus in favor of
this proposal as it is written here, a CFV will be posted, which
will initiate the voting process; otherwise, discussion will
continue until a more refined proposal can be prepared.

After the CFV is posted, the voting period will be at least 21 days.
If the group passes by receiving 100 more YES votes than NO votes,
and (at least) two-thirds of the total vote is affirmative, the
newsgroup
rec.radio.amateur.low-profile will be created.

Again, please do *not* vote now. The voting process has not begun,
and your votes will be DISCARDED if you attempt to do so.

For more information on the newsgroup creation process, see the
documents entitled "How to Create a New Usenet Newsgroup" and
"Usenet Newsgroup Creation Companion", posted regularly to news.groups,
news.announce.newusers, and news.answers, and available for ftp at
rtfm.mit.edu in /pub/usenet/news.groups.

72, 73 (best regards)
Adam O'Donnell <adam@libertynet.org>

853. PacComm Spirit-2 hook up.....

Newsgroup: rec.radio.amateur.space
Date: 1995-04-20 00:00:00 UTC
From: art.jeyes@jhuapl.edu
Message-ID: <art.jeyes.1148761512A@128.220.101.100>
Source record: 25253

Hi...

I am replacing my DSP-2232 with a PacComm Spirit-2 G3RUH TNC and am having some problems... was wondering if anyone can see where I have gone astray or make some sugguestions....

first lets establish the baseline ...
system currently is an Icom 970 hooked up to a DSP-2232 and in that configuration I get about 500KB on a good pass of KO-23/25 (pretty good considering I live in a valley and am surrounded by very tall trees)...

my Spirit 2 arrived yesterday (from the folks at PacComm) and I built an adapter cable that fits on the end of my IC-970 to DSP-2232 and adapts that cable to go to the Spirit... I set up a new communications configuration in WISP for a TNC-2 and setup for KO-23 & KO-25 to use that configuration.... everything looks good... MSPE comes up and the TNC goes into KISS mode ... DCD light comes on on the TNC about where I would expect it to but very few packets are decoded ...I had a great pass last night (my best with the Spirit-2) and only got 3K of data ... I rang out the adapter cable and found no shorts/or high resistance paths ....and since I am preperly decoding some packets I think it must be hooked up to the correct pins... Soooo... why no data????

Are there some setups I must do to the PacComm that I am missing???

HELP!!!!!

& 73

|>
|> MIR uses 145.55 simplex, some voice on this freq, usually they leave
|> the packet BBS on.
|>
|> Hope this helps, Dean N4TYS

I thought this was only for a specific mission (Mir-Shuttle joint) sometime
in July. The previous and following missions (I have been told) will use
the standard:

FM Voice Downlink: (Worldwide) 145.55 MHz
FM Voice Uplink: 144.91, 144.93, 144.95, 144.97, and 144.99 MHz
FM Voice Uplink: (Europe only) 144.70, 144.75, and 144.80 MHz
FM Packet Downlink: 145.55 MHz
FM Packet Uplink: 144.49 MHz

Is this incorrect ?

Ken:
The frequencies listed by Dean are correct for all Shuttle-MIR

docking missions. The frequencies you list will be in effect for all other missions. This year, only two docking missions are scheduled, STS-71, now targeted for early July, and STS-74, tentatively scheduled for late October.

I need help finding the names of companies other than Andrew, who make reasonably priced 2 ft to 4 ft parabolic antennas. I'm especially interested in commercial quality dishes that could be mounted on a tower and would survive reasonable winds. Things like spun or stamped aluminum, solid or perforated.

If you can send me any company names and phone numbers I'll be grateful.

Thanks,

Terry K7YNO

Terry,

I'm getting two 4' dishes from SWAGUR Enterprises. I'm going to be mounting them on a tower (one will be for WEFAX and the other for HRPT). You can reach them at 608.592.7409 or 73004.3461@compuserve.com

73,
Kevin N9JKP

If by Mac Sat program, you want an orbit calculation program, I'd recommend OrbiTrack 2.1.5 available from BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743-7114.

If you are interested in other Mac stuff, e-mail me with more scecific requests.

I'm sorry for the multiple posting. I have a beta version of Netscape and when I tried to post a reply it told me it was unsuccessful....It LIED to me for when I signed on a couple of minutes later I saw the multiple posts.

Again I'm sorry for the bandwidth, I'll be reporting the bug and I will be more careful

867. ATS-3 Info?

Newsgroup: rec.radio.amateur.space
Date: 1995-04-21 00:00:00 UTC
From: nogap@ix.netcom.com
Message-ID: <3n6ud0$p4v@ixnews3.ix.netcom.com>
Source record: 25255

Hello there.

Can anybody provide info regarding ATS-3? Specifically, I need
up/downlink freqs, modes currently utilized, and either a Keplerian
element set, or, if I remember correctly and this bird is geosync'ed,
where to find it.

868. What's up and working?

I was quite active on AO10 a few years ago and have been off for a "bit." I like to mode "B" birds in that type of orbit and am a little confused as to what is up and how it it working.

The Swagursat uses the 10.7 mHz IF output. It does seem to be a lot of $$ for the unit, but I have priced out filters and they are not cheap for this not common bandwidth.

The Swagursat converts the 10.7 signal to 455 kHz, and then applies the ~40 kHz filter before the detector. As shipped, mine had a response about 3 kHz low. It was a simple adjustment, however.

If the IC-R7100 follows my R-7000 design (I don't see why not) it has a 10.7 mHz IF on FM, and you can replace whatever filter you don't expect to use with a ~40 kHz unit. They are about $100.00. I have seen them offered by Spectrum International, but a few years ago they had prices that seemed pretty high (around $150.00).

The Swagursat is by far the easiest way to do it. I am using one, and once adjusted it has proved out quite well.

I never thought I would say this about an amateur newsgroup, but I
think this is a BAD idea, too narrow in focus and with too limited a base
of users.

Do you mean the topic of "antennas" is too narrow in focus? I would expect such a topic to catch the interest of quite a few amateurs. Seems to be doing that now, methunks.

Exactly! The rec.radio.amateur.antenna group already exists and
appears to be a perfect forum for the discussion of antennas,
low profile and otherwise.

If you have FTP access then try

ftp.demon.co.uk /pub/ham/mac

you'll find a couple of Mac Sat programmes in there all of which are Shareware, of there is also lots of other Mac Ham type software.

Regards,

Sean.

As a condo-dwelling ham, I can see a use for this group. It would be
handy to be able to exchange information about invisible antennas and
RFI/TVI type problems, etc., in a focused group. I couldn't say how many
people woudlpost to it, though. Anyone else interested?

What equipment is needed to 'listen in' to meteors? I have little knowledge of electronics (although willing to learn!) so the simpler the better. Pointers to information gratefully accepted.

876. Two-Line Orbital Element Sets (TLE590)

Newsgroup: rec.radio.amateur.space
Date: 1995-04-22 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.798576799@dolphin>
Source record: 25176

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Is there a program available (freeware) that would screen out the SPAM
that we are receiving via e-mail?

Ha! I think we need to tell these people directly, and via a suitable forum
such as (perhaps) 'news.admin.net-abuse.misc' that unsolicited e-mail is
most unwelcome and in some cases is abusive. Many of us have to pay for
the junk they send us! We need to stamp this out before it gets out of hand.

How many times have you missed a legal-type deadline because the notice was
buried in a bunch of junk you either threw away or didn't have time to look
at? You get the idea. We don't want that here.

Message-ID: <Pine.OSF.3.91.950422143730.15366B-100000@carbon.cudenver.edu>
Source record: 25179

Even though the GSC screen shows the schedule of selected satellites, the program takes CAT control of the FT736R, and also correctly operates the G5400B rotator, nothing shows regarding the satellites in the bottom portion of the screen.

Also whenever I clock on any line in the schedule, I get an error message about being unable to find it in the "pass list". I can find no reference in the help screens to any "pass list."

Thanks.

Larry, W0EIE

Subject: 72 pin memory for sale
Reply-To: levin@utw.com
X-Newsreader: IBM NewsReader/2 v1.09
Distribution: CA

Hi,

I know this is not generaly a for-sale group but since
I spend lots of time here I thought I would post this
quick for sale message:

I have 2 16meg 72 pin memory chips for sale. They
are new, tested and unused. I have the origonal
invoice as well. Selling them because another
deal fell through and I have no use for them.

The price is $1000.00 If you are interested
please email me at levin@utw.com

Thanks

Chris Levin

Would anyone know of any sources, other than the ARRL Antenna Book, for information on Helical antenna design, construction and applications? I an curious to know if they are usable for Goes sattelite reception. I have the impression that they are, but would like to be certain before starting to construct one.

Leonard,

The best book would probably be _Antennas_ by John D. Kraus. 2nd Edition.
You can use it for GOES WEFAX, you will lose about 3dB but you won't have to
worry about aligning the antenna with the satellite's antenna's polarity.

Not only does it seem that way to you, Roland, but it seems that way to the rest of us, as well.

So, have you sent in your comments, about this proposal, to the FCC, yet?

It's getting to the point that in order to live somewhere these days, it's necessary to waive all kinds of rights and otherwise regular privileges, including those pertaining to antennas that are normally at least partially protected by PRB-1. Condo and apartment living is becoming more common as single family dwellings are becoming less affordable and an increasing number of amateurs are being subjected to these severe restrictions.

The issues that might be addressed go beyond just a type of antenna. A rec.radio.amateur.low-profile newsgroup can deal with and provide help with both "stealth" antennas and the issues that make them necessary.

As for one who has had to deal with using "hidden attennas" I feel this newsgroup would be highly useful. As for those who might not feel this way, dont knock it until you have had the :pleasure" of working Alaska or Hawaii using 30 ga magnet wire for your attenna. The contacts at times my be rough but just as rewarding as any contact that can be made using Full size attenna's.

Are you using a VGA Color monitor? On my system some passes are show in
low intensity. I believe those are passes, where the Maximum Elevation is
5 degrees or less. So while techincally visible, in a pratical sense a
sighting or communication is not likely.

Leonard:
Check out "The Satellite Experimeter's Handbook". It is available
at most Amateur Radio dealers, and also from the ARRL. You might also
check your local library.

SB NEWS @ AMSAT $SPC0424
* SpaceNews 24-Apr-95 *

BID: $SPC0424

=========
SpaceNews
=========

MONDAY APRIL 24, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* OZ7SAT NEWS *
===============
OZ7SAT is the joint effort of a group of Danish hams: OZ1DTI, OZ1LBM, OZ2ABA, OZ2BOA, OZ6BL, OZ9ADL, and OZ9VQ.

OZ7SAT is an automated groundstation and the eventual plan is to become part of the world wide Satellite Gateway (SatGate) project, most likely using LO-19 as the assigned satellite.

The present configuration of OZ7SAT is up- and downlink capability for the 1200 baud birds using a FT-790 on 70 cm and a converted Scanti radiotelephone on 2m. The 70 cm antenna is a 6 element yagi elevated about 30 degrees and the 2m antenna is a 4 element yagi mounted horizontally.

The TNC is presently a loaned DSP-12, but the group has purchased and built a DSP-93 which will be commissioned when the switch to LINUX is made.

The controlling software (PB/PG, WNOS and a lot of batch programs) is presently running under DOS on a 386 PC, but as DOS is a single thredded operating system, the software structure is very complicated and it has been decided to move to a LINUX platform this spring.

OZ7SAT is connected to the Danish terrestrial packet network via OZ2BOA, to which a separate link is established on 70 cm.

More information is available from Bent, OZ6BL.

[Info via OZ7SAT]

* WEBERSAT NEWS *
=================
WEBERSAT (WO-18) is broadcasting new images and light spectrometer data weekly. Software for the extraction, decoding, and display of spectrometer

data, written by Bob (KB7KCL), is available by request on AO-16/KO-23, or directly from Weber State University. Monday UTC, continues to be the day for the broadcast of the most recent spectrum, along with the week's WOD.

WeberWare 1.0, 1.2, 1.3, or a similar program is required for picture extraction, decoding, and display. WeberWare 1.3 is the current software version, and is available from Weber State University, AMSAT-NA, or AMSAT-UK. Photo 8/12 was taken over N. Ethiopia, and Photo 9/13 was taken over N. Chile near the coast.

Henry, ZL1AAN has been uploading JPEG compressed WeberSat images to AO-16 along with some helpful hints on contrast and colorization adjustment. Thanks, Henry!

The satellite now has a weak and relatively steady tone of about 1200 Hz in the downlink signal, which can cause reception problems with some modems. If this problem occurs, a ground-based solution is to adjust the IF-shift of the receiver to suppress the carrier into the skirts of the IF filter.

WO-18 is currently sending BCR +10 volt bus 0x21, BCR set point 0x22, +Y array current 0x29, battery 1 temperature 0x2F, RC transmitter output power 0x33, and +Y array temperature 0x36 whole orbit data (WOD). This is an excellent opportunity for a student, group, or class to use this data in trying to better understand WeberSat's power management system. WOD collection and broadcast will adhere to the following schedule:

17 April/Week3: BCR, 21 22 29 2F 33 36
24 April/Week4: Temperatures and impact detector, Ch# 14 2F 30 35 3B 40
1 May/Week1: Array currents, Ch# 26 27 28 29 2A 2B
8 May/Week2: User requested channels, Ch# ?? ?? ?? ?? ?? ??
15 May/Week3: BCR, 21 22 29 2F 33 36

>units and CONdos as well as QRP fans (even though I run about 30W ... :).

I'm undecided as to how I'd vote for the proposed group, but the above suggestion is an entirely different topic. I live in an apartment, and have done so for virtually all of my time as a ham (the other time was in a duplex with a small yard, so it still sort of applies). I haven't run much QRP. In fact, the closest I ever really came to QRP was when I was using a loaner HF rig w/ my 4.5 Amp power supply---I had to limit the transmit power to < 10 watts to avoid going beyond the power supply's limits. Even the 30m xcvr I built once ran about 15 watts....

In my current apartment, I have full-sized dipoles folded along the (wood) stairs (like many buildings along the coast, and particularly here on the island, this apartment building is built on stilts to help protect it from storm surge in a hurricane/himicane). When I run voice (rare) or cw, I run a full 100 watts. When I run AMTOR/PacTOR, my HF rig automatically cuts the power down to about 50 watts due to the high duty cycle.

Do I have RFI problems? Nope. I did, briefly, when a neighbor had a quick-disconnect cable between his TV and VCR, but that took a few seconds to fix, and has never re-appeared.

If anything, though, I think a QRP group would be more fitting than a sub-group for restricted space antennas, which, IMHO, is probably ok right here.

Just my $0.02, all IMHO, of course.

Later,

IMHO this is a much better idea then the current name. My feeling is
there is a much broader base of users for qrp, and it could include the
low profile people also, since they seldom run 1000 watts.

Hi Jim,
Just a quick note to see if thie E-Mail thing works and to wish good health and recovery to Mary and Jake. We have a mild Santa Anna going on here the last two days so its been in the 80s'. Feels like spring is finally here although I suppose we could have a few more storms before the season is over. I've been planting a garden so Jerri can have all the organic vegitables the Doctor has been telling her to eat. We hear you've had another snow storm since we last talked. Those wet spring storms can be some of the worst in your part of the country. I can remember my Dad waking me up in the middle of the night to go outside with him and climb the trees to shake the branches free of snow so they wouldn't break under the weight. Actually, once I was awake it was kind of fun. Well, talk to you later.

Steve

Greetings Robert,

I am currently running Winorb2.3 (I think it's on ftp.ucsd.edu) and this is what I do. First I anonymous ftp archive.afit.af.mil, cd to the space directory and get the file; tle.new (this is updated ~ 24HR). I copy the tle file to the winorb directory and rename it to tle.2li. After firing up winorb I select "Satellite Info..." from the main satellite window. When the "Satellite Info..." dialog appears I select "File" from the dialog window menu, one selection this menu caontains is the "New 2li" command, I selcect it and then select the tle.2li file. Once that is done I can scroll through the satellite selector window and double click to choose any listed satellite to view. OBTW, you can also type the name of the satellite you wish to view in the current satellite box in the dialog box to select a new satellite. Hope this helps.

Source record: 25111

I hope a few Western European operators are watching this news group who are on RS-15. I am a bit discouraged with trying to work into Europe from here (CN85). I have a fairly short window into Europe and signals are pretty weak with QSB. I have one partial QSO with an SM4 on SSB, but not sure of his call. For those who would like to try to work the West Coast of the US, please use CW. I do not know how it is across the Atlantic, but there seems to be some kind of birdie around 29.360. Almost impossible to copy thru it here. I will try to be between 29.370-80 on CW from this end. I can usually copy my CW til about one minuite before I lose the RS-15 beacon, so I can get pretty close to the horizon from here. Very frustrating from this end my friends. Hope to catch some of you on RS-15. 73's de Dave, N7DB (CN85)

Gohd, I hate being prototypical, but a `me too' for this one. When we were creating the new rec.radio.amateur.* heirarchy, this (*.qrp) was one of the proposed groups that disappeared because of not enough support though ..., but I would expect more support for the slightly broader *.qrp group than for the badly named *.low-profile (my prior comments about low-profile surface mount components).

:not just limited to discussion about antennas. Topics I
:forsee include:

* dealing with landlords and covenants
* TVI and RFI to others
* TVI and RFI interference to your operation from
others.
* negotiations with neighbors on operating
* strategies for HF operations to stations out of
your own state on extremely ineffecient antennas
and low power.
* RF safety in extreme proximity.
* operating satellites with low profile equipment.
* Urban emergency operations using rapidly deployed,

improvised installations.
* Care and feeding of the older, less expensive
equipment us "stealth" operators seem to use.
* Installation of the shack in very space challenged
areas that the XYL or other significant other
lets us use.
* How to get a good ground on the 27th story.

:None of those topics are related to antennas. Of course, I
:also would include:

* help with making an HF antenna that is nearly
invisible and gets out.
* invisible commercial HF antennas.
* help with making a VHF or UHF antenna that is nearly
invisible and gets out.
* invisible commercial VHF/UHF antennas.
* antenna modeling
* antenna installation tips and hints

:For those of us who are not rich, never will be rich, and have
:less space to work with all the time, this group looks wonderful.
:Please vote yes.

Low-profile ham radio is an extremely challanging and highly specialized
pursuit of the Hobby. As quoted herein, there are a myriad of subjects
that need to be cussed and discussed. I have been a fan of operating
my HF station under all kinds of conditions, mobile and portable and
I highly endorse this newsgroup. Just because some of us are fortunate
enough to have full-size dipoles and gain antennas NOW, remember that it
wasn't always this way and that there are others who need this exchange of
specialized information to learn and experiment to improve their skills
and talents in this area.

If the Net can support 8,000 + newsgroups, would one more really make a
difference? Next tine you take a trip, try taking along a 40M QRP
transciever and some magnet wire and try to make a contact or two.
This kind of activity can be great therapy after a day full of snake-pit
business meetings. Try working some of your buddies back home from your
Company-paid hotel room. Its a lot of fun! At least if you are not into
trying this, you may find it enjoyable and entertaining to read the experience
of others. Remember, the basis of our Hobby and license is EXPERIMENTATION!
With the proliferation of consumer-grade transcievers and "rice rockets"
which are not generally user-servicable, can any of you tell me any areas
of research and experimentation other than antennas and operating under
low-profile conditions? So, loosen up you detractors, and think before
you condemn! No one's twisting your arm to read or participate in this
proposed newsgroup. You probably wouldn't have much to contribute anyways!

Donning asbestos suit! Fire away! But no replies until after Dayton!

?

The reason for a group is to be if there will be sustainable discussions. This group is being proposed has a *lot* to do with rec.radio.amateur.antenna with a bit of the inflamatory rec.radio.amateur.policy thrown in to boot. If the existing group structure can support discussions proposed in the group, then one should ask `Why do some people feel the existing group is inappropriate for this discussion'.

>Next tine you take a trip, try taking along a 40M QRP
>transciever and some magnet wire and try to make a contact or two.
>This kind of activity can be great therapy after a day full of snake-pit
>business meetings.

You just described the entire rec.radio.amateur.* hierarchy, minus the previously proposed (and failed) group rec.radio.amateur.qrp ...

Ciao -- Mark

MIR operates simplex. The uplink frequency is also 145.550.

You have to set the priorities for the satellites. If there
is a priority conflict or a priority has not been set this
seems to happen. You can put a satellite in the list with
a priority of 0 and it will show up in the pass list but you
will not get the radio tuned. I

917. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-04-29 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.799126925@dolphin>
Source record: 25117

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293

The Mir Uplink is 145.550 and the downlink is 145.550. It is a simplex frequency. You need about 20 watts on a dipole to hit them. But if you want to listen to them, all you need is an outside dipole. Remember they are Russians and they run buy Moscow's time.

I made contact with MIR using 5w (HTX-202 @ 12v) with a 1/4 wave ground
plane antenna made out of coat hangers. I know others have heard MIR with
just a rubber ducky.

The bottom part is an informational text box. To have it list a satellite, click on
"TRACKING" on the menu bar, then "Track" and you will be given the choice of a
satellite to add.

I need some form of elevation rotor. Would like a Yaesu 5400 but I dont think I can afford one unless the price is right. Will settle for an alliance that has the mast thru the center. This will be used for small sattelite system so I am not worried about it being too small. Please email me. with Price,specs and how to get in touch with you by phone.

Due to it's (very) small scope, I would also say that this isn't a good
idea. Perhaps a maillist could better serve this focus.

932. Re: M2 Eggbeater Antennas

From: "Walt (N3JPR)" <lrpst5@pitt.edu>
Message-ID: <3o3ikg$56a@usenet.srv.cis.pitt.edu>
Source record: 25132

Ed,I have been using the 2 meter version of the Eggbeater for 5 months now and I have compared it's preformance with my stacked 13's Cushcraft beams for working RS-10,RS-15 and AO-27.When the sats are at a low angle both antennas preform about the same however I must use more power with the Eggbeater because of it's gain of 1. When the sats get near overhead the Eggbeater really shines,I cannot get into the sats with the beams but the Eggbeater does the job with ease. I have tried recieving the oscars with both antennas and the results are the same.The M2 also works pretty well on 2 meter SSB.
Hope that helps.

933. 2 m radio for balloon project

Newsgroup: rec.radio.amateur.space
Date: 1995-05-01 00:00:00 UTC
From: Iver@ksu.ksu.edu
Message-ID: <3o2lav$t94@fox.ksu.ksu.edu>
Source record: 25133

Has anyone in this group designed telemetry for the Ham Radio Balloon projects? I'm looking at doing one here in Manhattan Kansas and have an idea I'd like to discuss.

The balloon will be operated from a Basic Stamp (microprocessor programmed in Basic) that has a command for sending data via serial. My question is can I send serial data to a little Baycom modem (used as a cheap TNC for things like laptops) and then to a 2 m radio to do packet?

Just what does the software for the Baycom do? And can this be programmed in the Basic Stamp?

I was thinking the software just puts headers on the data before sending it out the com port. It would seem I could do the same for the Basic Stamp. I don't want the balloon to be receiving data from the ground, I just want it to transmit telemetry data in packet that anyone can listen to with packet.

Am I off base here?
Thanks

MONDAY MAY 1, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is
published every week and is made available for unlimited free distribution.

* MIR NEWS *
============
It took a few weeks, but the crew finally had time to work on their
Personal Mail System (PMS) which allows Amateur Packet Radio messages to
be exchanged with Amateur Radio Operators on the ground. The crew thought
the problem was with the Lap-top running the TNC. The problem turned out
to be some incorrectly set TNC parameters. The TXDELAY parameter was set
for zero delay. It should have been 300 milliseconds. Dave Larson
(N6JLH), spent many hours waiting for the crew of Mir to come on the air
to assist them in adjusting the TNC parameters. The PMS is now working,
but the tiny 22 kilobyte mail buffer is filling up fast.

The Mir crew found out that Russia and the USA do not have a full time
Third Party Agreement. There was a temporary agreement when STS-60 was in
space, but that one expired. There are plans to put another temporary
Third Party Agreement in place, during the STS-71 mission (the docking of a
shuttle with Mir), but this agreement will also expire at the end of the
STS-71 mission. Since there are no permanent agreements between the USA
and Russia, this will limit some of the message forwarding and telephone
patches with the Mir crew and may affect some schedules with school
students. A permanent Third-Party agreement would be very advantageous to
have in place for future radio contacts with the cosmonauts on the Mir
space station.

Remember, only 1 station can connect to MIR's PMS at a time, ALL others
must wait.

* SOFTWARE ANNOUNCEMENT *
==========
The latest version of WinOrbit (2.4) is now available on oak.oakland.edu
(see below). A description of changes, and an overview of the program,
are given below:

Major Improvements in 2.4

- "View from Space" orthographic projection (slow - not in real time).
- Sun and terminator line now move automatically in real time (if displayed)
- Fixed European (esp. German) number format bug (",").
- "Print to File" option for ephemerides.

Program Overview

WinOrbit is a program for computing artificial Earth-satellite position and
visibility, with the Amateur Radio satellite operator in mind. It was
written for the Microsoft Windows 3.1 operating system. WinOrbit is FREE
(not shareware). The latest version is 2.4.

The principal feature of the program is a series of tracking windows, one
per satellite, which display the current position of the satellite and the
observer on a simple world map, together with information such as
footprint, past ground track, bearing (azimuth), distance, and elevation
above the observer's horizon.

Additional features include:

* Real-time, pseudo-real-time, and manual calculation modes.
* 4 different orbital calculation algorithms (selectable).
* DDE server interface to tracking-antenna hardware controllers.
* Simultaneous tracking of up to 20 satellites.
* Selectable tracking detail, including doppler shift and free-space path
loss, for a single satellite.
* Display sun position for eclipse determination, and other observers for
mutual visibility.
* Tracking data (Keplerian element sets) read directly from standard, off-
the-air bulletins in two different formats (up to 200 satellites). No
pre-processing is needed.
* Propagation of pre-launch keps and other element updates.
* Observer (QTH) data (latitude, longitude) may be imported from a simple
text database (up to 1000 locations). Entry by grid-square is

possible.
* Printing of tables of tracking and scheduling data in several formats.
Table generation doesn't interfere with tracking.
* On-line help, including direct access to text information about Amateur
satellites from the tracking windows.
* Standard Windows interface for all functions - no commands to memorize.

This program is available via internet, by anonymous ftp from:
ftp.amsat.org in /amsat/software/windows/tracking/winorb24.zip
oak.oakland.edu /pub3/hamradio/pc/satellite/winorb24.zip
(as of 4/21/95 only the oak server has been updated)

Future enhancements might include (depending upon interest):
Bug fixes (when reported by users)
Corrected/augmented satellite information supplied by users.
Enhanced satellite database maintenance features
Additional table formats (as requested by users)
Fancier map formats
Sun/Moon tracking for EME/antenna calibration
Speedups
Rotor and rig control interface

Sorry Dave, but low_profile still makes me think of small, short radios.
Not low impact operating. There is also the '/', I'm not certain it's
allowed in group names, at least I couldn't find any current use of it.
I still think that qrp or qrp_something_else would work better. Let's see

rec.radio.amateur.qrp I think this has been voted down
before, but I don't understand why
.low_profile I don't think it tells the 'story'
.qrp_low_profile As above
.qrp_hidden Just thought of this one
don't know how good it would
really be, but it could cover
qrp, fox-hunts and 'low_profile'

Message-ID: <1995May2.174040.150@inca.comlab.ox.ac.uk>
Source record: 25137

Hi,
I've been trying without success to compile Manfred Bester's
SatTrack program, Version 3.1 on our University DEC Alpha AXP2100 system,
but having problems with the checkKeyboard() function, which contains
several ioctl statements, #ifdef's for different machines, none of which
will build successfully on the Alpha system here. OK, I deleted them to
get it to compile, but obviously that results in a certain loss of
functionality... :-)
If anyone has got this software to build successfully on any
DEC alpha system, under OSF1, I'd be really glad if they'd Email me.

Thanks, 73 de Paul, g7ndc

It does quite a bit more, and the STAMP just doesn't have enough
code space. Have the STAMP send the string to a PacComm PicoPacket,
and the output from that to your Baycom. Any other TNC will do, but
the PacComm is _tiny_, cheap, and full functioned.

How much code space is there? I put together a 68HC811 with the '3105 modem
chip and the code to collect the GPS data, plus voltage, temp. and
pressure, and to format it and send it out is under 1K.

There is a parameter in the TNC called "LOCATION" which allows the info
from the GPS to be beaconed as UI frames. The TNC must state GPS
support during the power-up "welcome message", otherwise the EPROM must
be upgraded. I observed it's operation during Dayton and it seemed like
alot of fun

Yes. Briefly, here is the process. After a flight, the many roles of film are processed and cataloged. Crew schedules are quite busy after the flight. Then each picture must be reviewed and "captioned." at some point, the crew picks pictures and text for their QSL card. This is sent to the ARRL for printing. After the ARRL prints the cards, they are sent a club in charge of QSL cards for that particular flight. During this time, the packet worked and heard lists are sent to the clubs, as well as, a transcription of the voice tapes. There are usually four or five hours of voice tapes to be transcribed.

Then, the club fills out all the QSL cards and sends them out.

STS-64 and STS-65 are just now getting sent out. I apologize for the delay, but be patient (I haven't gotten mine either).

We are starting to release STS-65 QSLs today (5/3/95). Your patience is appreciated for all SAREX missions as it make take up to a year to get a SAREX QSL. The shuttle crew usually helps design the card after the mission is completed using pictures from the mission. To date, we have received over 650 cards. We hope to have all of the cards out by the end of May.

73s,
Charlie AJ9N
STS-65 QSL Manager
Lake County (Indiana) Amateur Radio Club.

It (use of /) is specifically forbidden. The length must be less than 15
characters.

> I still think that qrp or qrp_something_else would work better. Let's see

The narrower and more restrictive the group topic is, the less support
it will have. QRP is well understood and has lots of interest. Heck,
even I'm interested in QRP, and I have 75 acres in the country. Let's
keep the name short, sweet and well understood.

> 73's Ralph
> (trying hard to find a way I could vote for this idea)

Me too. rec.radio.amateur.just_us_guys_in_condos isn't going to get
a yes vote from me :).

>Dave, K9SW

Forward (and backward) slashes are "forbidden" characters in newsgroup names. The reason is that all news server software sooner or later has to access files and directories, and since the usual convention is to map the dot-delimited components of a newsgroup name into subdirectory names, the slashes could possibly be misinterpreted by the operating system as directory-name separators.

954. Two-Line Orbital Element Sets (TLE600)

Newsgroup: rec.radio.amateur.space
Date: 1995-05-05 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.799712351@dolphin>
Source record: 25154

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

955. Re: RFD: rec.radio.amateur.low-profile

Newsgroup: rec.radio.amateur.space
Date: 1995-05-05 00:00:00 UTC
From: jeffrey@math.hawaii.edu
Message-ID: <D83B43.Mt5@news.hawaii.edu>
Source record: 25155
Cross-posted to: news.groups,rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.amateur.policy

Please stop suggesting rec.radio.amateur.qrp - there's already a very
fine qrp email list with a high S/N ratio. Last count there were
400 subscribers. Now that doesn't sound like enough to warrant
a newsgroup, does it? In the past 3 years every time a suggestion
was made to shift from an email list to a newsgroup the suggestion
was always vehemently voted down.

If the low-profilers want a group, then why not start an email list?
Such lists are very very successful, for they target a select-interest
group and as a result the noise level is quite low (no flame wars).

With well over 7000 newsgroups some sites may have reached the saturation
point and choose not to subscribe to the new rec.radio.amateur.low-profile.

73 from Hawaii,
Jeff NH6IL

>
There is a parameter in the TNC called "LOCATION" which allows the info
from the GPS to be beaconed as UI frames. The TNC must state GPS
support during the power-up "welcome message", otherwise the EPROM must
be upgraded. I observed it's operation during Dayton and it seemed like
alot of fun

Subject: SatTrack 3.1 on DEC/OSF1 ??

Hi,
I've been trying without success to compile Manfred Bester's
SatTrack program, Version 3.1 on our University DEC Alpha AXP2100 system,
but having problems with the checkKeyboard() function, which contains
several ioctl statements, #ifdef's for different machines, none of which
will build successfully on the Alpha system here. OK, I deleted them to
get it to compile, but obviously that results in a certain loss of
functionality... :-)
If anyone has got this software to build successfully on any
DEC alpha system, under OSF1, I'd be really glad if they'd Email me.

Thanks, 73 de Paul, g7ndc

Subject: STS-65 QSLs

We are starting to release STS-65 QSLs today (5/3/95). Your patience is appreciated for all
SAREX missions as it make take up to a year to get a SAREX QSL. The shuttle crew usually
helps design the card after the mission is completed using pictures from
the mission. To date, we have received over 650 cards. We hope to have all of the
cards out by the end of May.

73s,
Charlie AJ9N

STS-65 QSL Manager
Lake County (Indiana) Amateur Radio Club.

A friend is in to packet radio. He is a teacher who wants to use it with
his Macs in the school to show students part of the radio world.
Can anyone point me to any information on connecting Macs to packet radio.
He doesn't want to, but if forced, he will consider other platforms.
I'm not acquainted with this area, I'm just posting for my friend.
Thanks for your time.

Scott

If you are talking about terrestrial AX.25 packet, all you need is a
terminal emulator such as the shareware ZTerm.

For TCP/IP there is NetMac.

All you need is a TNC connected to one of the serial ports.

Hi All,
Many thanks for reading this plea.

Can anyone advise me the makes and model numbers of DX4 or
Pentium computers that give the least (or zero, hi!) interference
on 2 metres.

(I normally use 2 cascaded GaAs FETs on front end)

Unfortunately, manufacturers change designs at the drop of a hat, so trying to go by a model number is not likely to be a sure thing. From my experience, the most likely source of interference is not the computer itself, but rather the monitor. Two suggestions:

1. Take a two meter HT with you when looking at different models.

2. If the computer is made in the US, look for a label stating compliance to class B EMI standards. You'd think class A would be the best, but not so. A is for industrial or commercial areas where more interference can be tolerated and B is for home use where interference to TVs, radios, etc is likely to be greater, so B is actually more strict.

I have a class B computer here and have no problem at all on two meters. There are some weak harmonics at several places in the HF bands, but nothing I can't live with. As I mentioned, nearly all of them are from the monitor.

Good luck.

Hi pete

I could not find a search feature on your web page. There was a long unformated list or index. The folks at QRZ cd-rom have a callsign look up search and they have lots of amateur radio files and programs to down load.

Please provide a service to this amateur community. QRZ does not advertize here....every one links to them on the web! There is room to compete with out filling every radio news group with pointers to your off shore order form. Is it a secure server for credit card info?

According to Martin Lynch's (Ealing, West London) latest propaganda (see ads in various magazines), his range of 'radio ready' PCs (made by Peacock) were specifically selected for their low RFI.

However, since Martin was also the guy who assured me that the Yaesu FT-5200 was a high-quality rig with a super front end and nice tx audio, I would test one very thoroughly before buying if I were you. Maybe a posting in uk.radio.amateur would help you find a Peacock PC owner.

You're getting closer. The key to 'low-profile' operation is antennas.
Everything else is easily hidden. But the antenna has to be
electromagentically exposed to the whole world, but visibly hidden from your
neighbors. Quite a dicotomy. I think the terms 'secret', 'covert' or perhaps
'hidden' best describe this type of operation rather than 'low-profile.'
Definitely not 'QRP', as this is already well-developed as its own specialty,
and covert stations may be medium or high power if desired. The best antennas
for QRP use are very high-profile, so there would be an immediate conflict in
trying to include this topic in with the QRPers.

I definately agree. My new kenwood TH-79 goes crazy in front of my 17"
Mag Innovision monitor. It just goes nuts, that's the best way to
describe it. I doubt there is any solution to this problem, except to use
an external antenna far away from the monitor. Does anyone else have a
solution to this annoying problem?

Scott,about any TNC available out there will work on the Mac.If your
friend is looking for shareware,like another reply says,Z-term will do the
job.There's also another program called Savant that works on the
Mac,however the demo version is severely limited.Going towards comercial
packages,both Kantronics and AEA have Mac versions of their host
software.I prefer Kantronics Hostmaster,wich he should be able to buy for
about $50 directly from them.This software not only suports packet,but
also the other digital formats like RTTY,AMTOR,PACTOR and so on,when used
with the proper TNC (i.e. Kam +).
If you folks have FTP capabilities,give a try to oak.oakland.edu/ham/mac
server,where most recent Macintosh shareware is available.Also,I run a
small BBS here in Washington,DC that has a good collection of the said
shareware.It will just cost you whatever long distance charges to call
in,the acess is free.
Feel free to contact me via e-mail,Usenet or the BBS if your friend has
any questions.

Macs are no more difficult to connect to a TNC than PC's. He'll need to
have a terminal program running up on the Mac (Z-Term, TermPlus, FreeTerm,
etc.) to allow the computer to talk to the TNC, and an appropriate
connecting cable that goes from the Mac's 8-pin serial port to the TNC.
Set the TNC and the terminal program to talk at the same baud rate, and
plug 'em in. That should be about all there is to it. Both of my Macs
(an older SE and a Performa 475) work quite well as packet talkers, and
there are specialized programs available should your friend want something
besides what his terminal program provides.

Feel free to email me directly if he needs help.

BTW - rec.radio.amateur.digital.misc is probably a better newsgroup for
discussions like this.

Does an LCD display cause interference also? Less so, I'd imagine.
How about active versus passive matrix? Color versus monochrome?

Previous versions of the ARRL Handbook have given details on
making a cheap satellite antenna, called a TURNSTILE ANTENNA.
It is constructed with two dipoles crossed at right angles with
a simple matching system, and a chicken wire relector. This
type of antenna provides maximum pattern in the vertical mode,
as against a standard whip, which has zero functions at the
absolute vertical mode, which is exactly what you do NOT want
for satellites. (The standard whip works great on the horizon,
which also happens to be the longest distance to the satellite.)

982. Mode A receiving antennas

Newsgroup: rec.radio.amateur.space
Date: 1995-05-08 00:00:00 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9505081311.ZM4560@SALCIUS2>
Source record: 25083

I discovered this weekend that my new HF vertical doesn't receive Mode A very well. I would like to construct two effective mode A receive antennas:
1. For Field Day.
2. For home use.

For Field Day I plan to use a rotatable dipole about 12 feet off the ground, 3 feet above the crossboom of VHF/UHF yagis. The dipole would track the azimuth of the yagis, and the dipole would be pretty close to the "ideal" 3/8 wavelength off the ground. Is this practical, or would 2m transmit energy desense the 10m receiver? (If so, would an HF lowpass filter help very much?)

At home, the same setup on my roof would be almost 1 wavelength off the ground, resulting (I think) in a lot of nulls. So instead I would like to try a 10m antenna in the attic of my 1-story house. I just put up a 10m dipole in the attic, but I was wondering if something else might be better.

Would a 10m turnstile antenna be effective without a ground plane underneath? Any other suggestions for a non-rotatable attic antenna for Mode A reception? (10m verticals and eggbeaters wouldn't fit in my attic)

983. 9600 packet question

Newsgroup: rec.radio.amateur.space
Date: 1995-05-08 00:00:00 UTC
From: wci@crl.com
Message-ID: <3om0sd$pga@crl4.crl.com>
Source record: 25084

I have a question about what equipment is necessary to access the
9600 bps capable satellites, i.e. KO-23, KO-25, et at. I gather that
you can use FM radios, properly connected for 9600 bps operation. My
question is what do you do about Doppler shift? Is it necessary to
correct for that? All the info about the satellites lists certain
frequencies. Should this be plus or minus Doppler?

Now, if you have to correct for Doppler, can you do it on standard FM-only
rigs that tune in 5 KHz steps? And, has anyone ever successfully used
a dual-band mobile rig to operate the Pacsats with only one radio?

Thanks very much for the help. I'm trying to figure out how to build
a small, portable Pacsat station.

Wayne,
If you are not using a pre-amp, you might try that first. I use a GAP Titan vertical which is 25' tall mounted about 15' above ground. Without the pre-amp, signals were fairly hard to copy (very weak). Using an ARR 10m receive-only preamp (about $29 if think), signals are strong and easy to copy with the same antenna. Rig is a Kenwood TS450 which is pretty sensitive by itself, but not quite enough.
73,
Tony

=========
SpaceNews
=========

MONDAY MAY 8, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* SAREX INFORMATION *
====================
NASA has announced that the launch of STS-71, which was to perform the docking with the MIR space station has been delayed. The new launch date has now be set for 19-JUN-95. This delay was caused by additional work need to move some solar panels on MIR and it appears that the work will not be completed in time for STS-71. Therefore, STS-70 will fly first and its launch date has now been set for 08-JUN-95. Both of these STS missions will be carrying the Shuttle Amateur Radio Experiment (SAREX). STS-70 with Discovery will carry the SAREX payload, courtesy Mission Specialist Don Thomas (KC5FVF) into a 28.5 degree orbit and the SAREX payload will operate with both FM voice and packet for six days. In order that there will be confusion about the downlink frequencies, those wishing to make a contact with STS-70 should note that the usual downlink frequency of 145.550 MHz will be utilized. STS-71, on the other hand, is slated to use a downlink of 145.840 MHz. The STS-71 Atlantis docking mission will use the MIR communication equipment to simulate SAREX as well. On that mission it will be FM voice only! STS-71 will be a 9 day mission. It will carry Pilot Charlie Precourt (KB5YSQ) and Mission Specialist Ellen Baker (KB5SIX) in a 51.6 deg orbit.

[Info via ANS]

* MIR NEWS *
============
The crew on the Mir space station is very busy. They are trying to rebuild the station in time to dock with STS-71, scheduled for launch on 19-Jun-95. The work is quite extensive and will require at least two space walks by the Russians (not Norman). Two solar panels need to be moved to make clearance for the shuttle. In addition, a power module will dock in May. A few weeks ago, the crew dismantled the shower and replaced

it with a Gyro. For the next few months, the shower will be replaced by wet towels.

Amateur Radio activities have taken a low priority. The crew is working very long days and they do not go to bed until around midnight (Moscow time, 5:00 PM EST). The crew is not in the habit of using any set radio schedule. Best times for contacts are just before bed time, from 3:00 - 5:00 PM EST. Contacts are usually 3-8 minutes long. They like to rag chew and expect everyone to wait until they call CQ before going on to the next caller.

The Packet Radio System is still not reliable, and the crew likes to conserve power by shutting it down at night. Work is still underway to adjust the TNC parameters to improve the packet radio performance.

I was wondering how much of a problem would remain, if one were to build
a metal enclosure, and include the LCD portable inside, open at the
front of course! Certainly LCD based equipment would be easier to do
this for than normal full sized monitors.

But even for a full sized monitor, how would a metal enclosure with
aluminum screen on front be? The screen mesh would be a pain to view
through, but it really depends on how important, how long and how much
reading is actually done from the tube while operating.

The biggest source of noise in my experience has been on the power
lines! With the equipment now all using switching power supplies, the
cheaper the equipment, the worse the noise, it seems. I had a night and
day difference swapping out the power supply in my PC, when the original
had failed. Presumably, you've already taken steps on the power line?

If the tube is color, and uses a shadow mask, IE isn't a Sony Trinitron, then its face is already effectively shielded. If the tube is monochrome, or a Trinitron, then fine wire mesh, painted flat black and and installed against the tube, will form an effective face shield, and serve as a glare filter in the bargain.

Where you have to concentrate your shielding is around the plastic case. You can either use metal, or a conductive spray. GC markets a spray that is effective.

Jeff,

Having just got everything going on the 9600 bd PacSats recently I thought I
jumpi-in;

Doppler - On the uplink, the PacSats seem to be able to compensate
quite well for the Doppler. I set the uplink freq as published.
On the downlink, I let my tracking program tune my receiver.
The problem I have with this is my received efficiency is not
nearly as high as when I am in the shack and 'hand-tuning' the
radio. I set the meter to the discriminator mode and keep the needle
adjusted to center. When I do this my download efficiency jumps
into the high 90% range.

The FM birds (KO-23, KO-25, UO-22) are very forgiving on the
Doppler issue. I generally begin to listen 6-8 khz higher than
the downlonk frequency listed and tune down as the bird moves
overhead.

As to your other questions, I am using a Yaesu FT-736R and I
made the modifications for 9600 bd. Not sure about using a dual
band mobile radio, I have never seen one that could tune the
downlink frequencies (but I am sure they exist, I have an older
dual-band mobile that won't go down to 435 mhz).

Good luck, it has been a challenge getting things going, but it has
been a lot of fun.

>
There are none that I know of. However, there are two with 10M downlinks.
Here is some text I copied from a FAQ on the intrnet:

RS-10/11 (Radio Sputnik) is for CW and SSB signals, so an all mode 2 meter
rig is ideal for transmitting to this bird. The input bandpass is from
145.860 - 145.900 and the output freqs are from 29.360 - 29.400 MHz. There
is also a morse beacon at 29.357 MHz.

RS-12/13, A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear
transponder.
However, this bird is unique because its input frequencies are in the
fifteen
meter band! This is also the only ham sat in the sky that requires more
than
a code free technician license to work it, because its input band is from
21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the
15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of
skip, this satellite can often be heard and worked when it's below the
horizon! At least one person has earned DXCC on this satellite! RS-12/13
is
bolted to yet another Russian satellite and its NORAD ID is 21089. RS-12/13
also has a ROBOT mode like its brother RS-10/11.

991. Mir EVA radio frequencies, experience?

Several notices have appeared recently indicating that the Mir space station cosmonauts will do several EVAs this month, beginning this Friday, May 12, in preparation for the upcoming docking with the U.S. space shuttle. If possible, I'd like to hear some of the radio transmissions from the cosmonauts' space walks. Two questions:
--any suggestions on which frequencies to check, e.g., the same ones as used for other FM voice comms from the Mir and Soyuz, 143.625 and 121.75?....and/or other frequencies? (The May/June issue of "Satellite Times" has an article on Mir and the Shuttle, but doesn't refer directly to Mir EVAs).
--has anyone heard any Mir EVA transmissions in the last several years?
Thanks in advance, Bill Black, Washington, D.C., email BILLBLDC@AOL.COM

A LEO will spend 67% of its time above your horizon at an elevation of 30 degrees or less. So to maximize your communications time, you need an antenna that puts most of its power in a lobe at 30 degrees and below. That's a good description of a 1/4-wave vertical. The turnstyle puts a null at the horizon (where you in fact need the most gain due to the greater path loss). It is only useful during nearly directly overhead passes, and only during the overhead portion of the pass. This is only a very brief window.

993. IT ST-1 error message?

Newsgroup: rec.radio.amateur.space
Date: 1995-05-09 00:00:00 UTC
From: ve7avw@ftcnet.com
Message-ID: <3omidr$lqs@beta.ftcnet.com>
Source record: 25094

Does any one using IT with AEA ST-1 know what the error message

OrbitDRV: Error 10810

is trying to tell me? Do I need a program update?

Any suggestions would be appreciated.

Arnie

Anyone have any experience with or thoughts about the DSP93?

I have a Yaesu FT736 and would like to get on KO23 and KO25 and
have the flexibility for P3D.

I'd appreciate any helpful suggestions.

Larry, W0EIE

All that is needed for a group to form is 100 more yes votes than no votes.

>In the past 3 years every time a suggestion was made to shift from an email
>list to a newsgroup the suggestion was always vehemently voted down.

And why I am not a member of the mail list ... (There is a hint in there).

>If the low-profilers want a group, then why not start an email list?

Because, the defined message of the low-profilers requires some active
information retrieval, something a mail list can not provide because of
it's more obscure nature. I do not support the low-profilers group because
it heavily overlaps the r.r.a.antenna group, though ...

>Such lists are very very successful, for they target a select-interest
>group and as a result the noise level is quite low (no flame wars).

You mother wears army boots, and dresses you funny.

>With well over 7000 newsgroups some sites may have reached the saturation
>point and choose not to subscribe to the new rec.radio.amateur.low-profile.

Even though I do not support the group, I would be pleased to distribute it
despite the 7000 newsgroup saturating my disk transfer statistics ...

This seems to be the best suggestion. I would definitely be interested
in subscribing. Such a mailing list should have some provision for a
daily digest as well, since some of us simply cannot receive many
messages daily without attracting adverse attention. (How about another
list called Internet.e-mail.low-profile ....!

>With well over 7000 newsgroups some sites may have reached the saturation
>point and choose not to subscribe to the new rec.radio.amateur.low-profile.

This is also a valid point. I'm pretty sure that I would not have access
to such a specialized newsgroup through my present means of access.

True, but much higer powers are need at 30 degrees or less, because of distance. And, you are attempting to compete with those hams for whom the satelitte is at a higher angle. At what point is it considered to be using excessive power? A pointable beam system should then be considered if working the sats at all over-horizon conditions is necessary. My reply was aimed at those just getting into the mode.

So am I right in deducing from this conversation that ther is no ONE
antenna that will provide reasonble performance over the entire pass?

I am now using a homemade J-Pole up on the roof, ant the signal
practically disappears when the bird goes above 33 degrees.

What about using both with a coax switch?

Thanks for all you opinions!

You need from 6 to 10 dB more power when the satellites are near the horizon as opposed to when they are overhead. Unsurprisingly, that's about the gain difference for a 1/4-wave vertical in the horizontal and near vertical directions.

You're considered using excessive power when the signal you deliver to the satellite is substantially stronger than that of other users. What ERP you have to run to deliver that signal level to the satellite is a function of your path loss of the moment. Using a low gain antenna and a big amplifier, or a high gain antenna and a little amplifier make no difference to the signal level you put at the satellite. ERP is ERP however you develop it.

I advocate the vertical if you aren't going to use steerable beams because its pattern most closely matches the changes in ERP requirement for the LEO satellites from near horizon to overhead of the various *simple* antennas. The turnstyle has the opposite pattern characteristic to what is desired. While it will allow slightly less power be used to generate the required ERP for the short overhead segment, it requires so much more power for the bulk of the pass that it's not a good choice. If a more complex antenna is acceptable, a Lindenblad or eggbeater may be a better choice. Both produce patterns that resemble a flattened hemisphere, and don't have the null directly overhead that the simple vertical has. (That null is very small in solid angle, however.)

Gary

>73,
>Wayne Estes WD5FFH wayne@csg.mot.com

My first year on RS 10 was with 5/8 wave verticals on both links. Passes below
20 degrees were difficult, but usable depending on noise and traffic. Adding a
10m preamp improved somewhat. The 5/8 wave null on overhead passes did not
pose any problem. I suppose the closer range helped, and of course the null may
not be very deep. My uplink power was 25 watts through 60 feet of RG-8.
Field Day on the Russian birds gets quite messy. I haven't worked RS-15, but
since it has a higher orbit, better antennas are called for.

Lets look at this a little differently. This is not a NET COPS issue.

What you are seeing is the local citizens here in these groups trying to clean up the graffitti and posters on all the telephone poles in our neighborhood. The NET COPS can't touch all that graffitti, they are too busy being NET COPS.

I don't think any of us mind a commercial poster with some new information or a new product to sell. You can't ignore it!

Just what does a new cd-rom of amateur programs found here on the internet, have to do with Amateur Space, Policy, Digital, Antennas?

This graffitti should be seen in rec.radio.swap where there is no confusion about the commercial nature of the offer.

Would you like this graffitti problem in your neighborhood? The inner cities look like Hell, because no one cares. These commercial cd-rom folks will stop advertizing in our Amateur Radio Magazines and post here for Free. Do you want all the nuts and bolts magazine ads in our news groups? Hunderds of those little ads every week over and over. Then no more ham magazines...

Almost as bad as the SALE@ALLUS on amateur packet. Does anyone really read all that junk? Oh Sure! go eat a cookie.

Bob ;-)

While unable to directly answer your question, I can offer my tips about pc-rfi. I wrapped several ferrite split-cores on every wire and cable inside my machine. This reduced the noise quite a bit. Also getting a good bond between the case, power supply and motherboard. Now only some highly active graphics cause interference. My line-voltage cables also have ferrite cores and are shielded. My GASFET is mast-mounted however. Best of luck.

I'd have to say the worse offender in this area is the monitor..
even a new model MPR-II rated, energy star, etc. monitor still has a
considerable RF problem. My monitor is >6 ft from the RIG, I still get
considerable noise in the 40M band from it. It would great if I could
leave it off, but what about packet? I've gone through some basics
to help the problem, including routing power cables away from the monitor,
sourcing power from another circuit, making sure everything is grounded to the same point,
etc. Granted, the ground in my place is not top-notch -- I have
a non-ground outlet house, and run considerable line to the nearest copper
pipe.
Dunno, seems like there could be a bit less radiation from that
monitor -- 6ft meets FCC class B standard anyhow.

I didn't reply immediately as I was a DSP-93 beta tester so may not be totally unbiased. But didn't want to let you go without a reply.

The main reason I got involved with the DSP-93 (I was using an AEA DSP-2232) was the ability to program the DSP-93. All software and hardware interfaces are documented as opposed to the other black boxes. The performance is as good or better than the DSP-2232. I use it regularly on KO23 and KO25. If you have mnore specific questions, feel free to e-mail me.

Almost all the computer make interference.
Here are some tips that can help to reduce the interference of a computer

1. The computer should be in a total clossed metal case
most of the computer have a plastic front or case. trough this plastic the
interference leaks out.
2. The metal case of the computer must have a good ground connection
if no ground connection is available try a radiator or make your own ground
connection
3. All grounds should be connected at ONE point (make no ground-loops)
4. Place a netfilter beteen the powernet and the power-supply-unit
most computer power supplies bring a lot of interference on the power net of
your building/group.
5. Every connection out of your computer carries interfernece out of your computer
if you have a modem it will increase the interference ot of the computer.
All devices (if possible) should be places in the computer.
Every line out of the computer works like a atenna.
6. Don't place the computer to near to your receiver/transmitter.
7. if you have different AC-groups in hour building place the computer on a other
AC-group.
8. if you have the money by a Class A product (most of the clones are Class C)
class A devices are the best.

Hopes this helps you in making a good choice for a computer.

Marco M.C.M. van heijnsbergen.

1014. HELP:Yaesu 726R Info. Needed

Newsgroup: rec.radio.amateur.space
Date: 1995-05-12 00:00:00 UTC
From: "Walt (N3JPR)" <lrpst5@pitt.edu>
Message-ID: <3ou8qo$7vf@usenet.srv.cis.pitt.edu>
Source record: 25016

I have been offered a Yaesu 726R at a very good price but I don't know
anything about this rig.I would like the following info. if possible.
1.What is the power out on 2 and 440.
2.Does it have a computer interface.
3.Does it have a packet jack.
4.Can the 2 and 440 be displayed at the same time.
5.How does it stack up against the 736R preformance wise.
Thanks for any help I really want to get started in
Oscar sats. and hope this rig will do.

>So am I right in deducing from this conversation that ther is no ONE
>antenna that will provide reasonble performance over the entire pass?

No. The Lindenblad has a good horizon to horizon pattern. It's a bit
tricky to construct properly. I had the phasing backwards on my first
attempt. The eggbeater styles are also reputed to work well from horizon
to horizon, but I have no direct experience with them.

>I am now using a homemade J-Pole up on the roof, ant the signal
>practically disappears when the bird goes above 33 degrees.

The J-pole is, of course, a 1/2-wave vertical fed with a stub
match (the J). It has a much more pronounced overhead null than
a 1/4-wave vertical. That's how it gets its gain over a 1/4-wave,
by squishing the pattern down toward the horizon. So it's not too
surprsing that you have difficulty with the direct overhead portion
of the pass.

>What about using both with a coax switch?

That's another option. You can use a gain vertical for the portions
of the pass near the horizon, and a turnstyle for the overhead
portion. But remember you want a mast mounted preamp, so you need
remote switching. When you have to resort to that sort of manual
intervention, however, you're getting close to the complexity of
using a tracking antenna and might as well consider steerable beams.
Even modest beams, 3 to 5 elements, will offer considerable improvement
over any omni-directional antenna, and pointing accuracy constraints
are loose. The 3 dB beamwidth is on the order of 30 degrees for a
short beam, so you can move it in rather coarse steps.

I've used a simple 4 element beam, elevated with a rope. I fixed
the azimuth before the pass by rotating the mast by hand, and just
pulled the beam through the arc with the rope during the pass. It's
simple and cheap, if a bit Rube Goldberg. But even the most modest
TV rotator can handle such a beam if you prefer a less manual method
of rotation.

Since we're getting off on a tangent here, let's step back and take a look. Even though netiquette frowns on advertising, I enjoy hearing of new products that are closely related to amateur radio. Let's face it...for those of us with 'Net access, we're going to hear about it here well before it hits CQ, QST or the other mags.

Here's something that works for the Linux enthuiasts: a moderated group for announcements, which permits new product announcements, as well as other announcements of general interest to that group. The subject lines for advertising-related announcements begin with "COMMERCIAL:" While I ordinarily dissaprove of moderated groups on censorship grounds, this works quite well. Linux enthusiasts can browse this newsgroup, skipping all posts that are clearly marked as commercials if they wish. The function of the moderator is to keep posts not related to Linux off the newsgroup.

So...I'll pose the question...are we ready to propose adding rec.radio.amateur.announce to the hierarchy?

Thanks guys...

This NET-COP phenomena is the damnedest counter-productive thing I have ever seen. If I was truly spamming the groups with some trash, I would love every netcop that jumped on my posting. Hey, in advertising, any press is good press. Let's say I only intended to post just once but I made a mistake and it took a couple of postings to correct that. I would have only created three postings about as long as this one is. If that was all, I would be worried about getting enough exposure. BUT NOOO... I can count on at least a half dozen jerks with their heads up their butts jumping on my case and keeping my ad running for at least a couple of weeks. It doesn't even matter whether or not my "ad" is relevant to the newsgroups I post it in. I certainly welcome the quarterly, less than 1k, posting about the Ham CD's. Even if I hated them, would I want to have the newsgroup cluttered with 100k of netcop ranting? A good cop understands some human nature and knows when to let things slide or when to just let go...

We have a similar group now. rec.radio.amateur.info

How about rec.radio.marketplace for new product announcements

Many of the other large collections of newsgroups have established the
marketplace group for similar posts. It has been proved quite popular
with readers, as well as the marketers. One stop shopping.

gatech!wa4mei!ke4zv!gary

Gary, is it possible to fill in that null a bit by putting a bend in the
antenna? Seems to me I've seen a number of aircraft antenna that are
essentially a 1/4 wave whips, with a 45 degree kink in them. I've been
told that's to keep that null from occurring so an aircraft doesn't miss
an important call or can't be heard momentarily.

☐ I'm interested in this both from the standpoint of the satellite
antenna, and also for a transmitting antenna on an ATV equipped R/C craft
- I've used a dipole in the past but when the craft turns, I get deep
nulls off the ends and lose the picture. I was thinking of putting bends
in the dipole elements, similar to what you see for some of those sine
wave curved simple FM antennas in the RS catalog.

Do you have any experience or ideas about this? I've used beams for RS10
and others in the past, but at the new QTH have been thinking of a simple
antenna as a backup.

Message-ID: <3p0a0u$jg4@insosf1.infonet.net>
Source record: 25028

I made my first contacts the other morning on RS-12(mode k) and was thrilled to death, but I have a couple of questions about procedures.
(1) does one put any special info on a satalite QSL card?
(2) does one tune the trx or rcv or both to compensate for doppler shift when calling CQ? or does doppler affect both trx and recieve frequencies the same so that no compensation is called for?
(3) If I hear a CQ on say 29.430 and I think doppler should be abt +2.5 kHz, do I add 2.5 to my trx frequency in hopes that I will be heard?

Any suggestions will be welcome, E-Mail or posts if its of general interest.

Tnx

>sites are compatible with SGP4 (Simplified General Perturbation version
>4) propagation model.
>
>What propagation model does QuikTrak use? Is it compatible with
>NASA/NORAD/SGP4?

You can get the two line elements from the following FTP site:

ARCHIVE.AFIT.AF.MIL

Look in /pub/space directory for the file tle.new, which has all the
satellites listed by name in order by NORAD# (or whatever the acronym is for
that government organization).

Decode 2-line elsets with the following key:

1 AAAAAU 00 0 0 BBBBB.BBBBBBBB .CCCCCCCC 00000-0 00000-0 0 DDDZ
2 AAAAA EEE.EEEE FFF.FFFF GGGGGGG HHH.HHHH III.IIII JJ.JJJJJJJJKKKKKZ

KEY: A-CATALOGNUM B-EPOCHTIME C-DECAY D-ELSETNUM E-INCLINATION F-RAAN
G-ECCENTRICITY H-ARGPERIGEE I-MNANOM J-MNMOTION K-ORBITNUM Z-CHECKSUM

I'm not sure about QuikTrak, but every other tracking program I've tries is
capable of using these two-line elements.

Make sure you note it is a satellite contact, the number of the satellite
(RS-12), and the mode.

> (2) does one tune the trx or rcv or both to compensate for doppler shift
> when calling CQ? or does doppler affect both trx and recieve frequencies
> the same so that no compensation is called for?

On RS-12 you tune whatever is necessary to get a contact going. Frequencies
are low enough that doppler is not a big problem. Most people are not full
duplex anyway.

> (3) If I hear a CQ on say 29.430 and I think doppler should be abt +2.5
> kHz, do I add 2.5 to my trx frequency in hopes that I will be heard?

Doesn't make any difference since most users are not full duplex. I normally
don't worry about doppler.

Thanks, I got a bunch of stuff and heard Mir 3 times today cos of it!! I'll work 'em as soon as they start talking!

BTW, just a random note for newbies out there... when I downloaded the elements, I tried to look at them on my PC and they were not at all lined up with the edges of the screen. I was worried, but QuikTrak sorted it out just fine. Just wanted to pass that along and keep someone else from worrying like I did!

If you're getting RFI from your monitor, check the background pattern you're
using on the screen- the worst case rfi generating pattern is a grey background
made up from alternating black and white dots- all guns on and all guns
off, switching everything as fast as you possibly can. This is one of the
patterns
we use for rfi testing. Go for a solid color to minimise emissions from the
video portions of the display. The horizontal width link can also be a strong
magnetic radiator if it's unshielded- high currents are present.

In article <3ovg7r$jtt@taipeh.hl.siemens.de> wscad22@taipeh.hl.siemens.de writes:
>Almost all the computer make interference.
>Here are some tips that can help to reduce the interference of a computer
>
>1. The computer should be in a total clossed metal case
>most of the computer have a plastic front or case. trough this plastic the
>interference leaks out.

This is a good tip. All openings in the case need to be shielded. There
have to be openings for ventilation, but these should be covered with
metal mesh, similiar to the way any other RF equipment is handled. The
case seams need to be joined according to good RF practice. For VHF
suppression, that requires that the joining surfaces be paint free and
a screw should be used every 5 cm along the seam. Alternately, finger
stock can be used at seams. Removable media disk drive openings can
be a problem. Usually, the best course here is to install shielding
behind the drive bay and just suffer the interference when a floppy
is being written or read.

>2. The metal case of the computer must have a good ground connection
>if no ground connection is available try a radiator or make your own ground
>connection

This is not necesarily a good idea. Connection to Earth may or may not
improve interference suppression depending on the topology of the station
and computer installation. Frequently, connection to Earth will *worsen*
interference. You'll need to experiment with your particular layout to
see if this helps or not.

>3. All grounds should be connected at ONE point (make no ground-loops)

This is a good tip. Ground loops will insure mutual coupling of interference.

>4. Place a netfilter beteen the powernet and the power-supply-unit
>most computer power supplies bring a lot of interference on the power net of
>your building/group.

This is also a good tip. However, the filter needs to be bonded directly
to the computer chassis. Filters built into extension cords may or may not
help, and can sometimes make interference worse.

>5. Every connection out of your computer carries interfernece out of your
>computer
>if you have a modem it will increase the interference ot of the computer.
>All devices (if possible) should be places in the computer.
>Every line out of the computer works like a atenna.

This is generally true. However, use of internal modems and such can make your computer more vulnerable to lightning damage. Properly installed and connected, external modems can have as low an interference level, and offer some lightning protection by keeping the telephone line surge suppressor's return path off the computer chassis. Careful thought to Earth connections, if any, can help here. Earthing the modem rather than the computer can serve to keep surge return currents away from the more valuable computer.

>6. Don't place the computer to near to your receiver/transmitter.

Generally good advice. This will reduce cabinet to cabinet induced radiation. However, proper shielding of *both* radio and computer will allow them to be placed adjacent to each other without undue interference.

>7. if you have different AC-groups in hour building place the computer on a other
>AC-group.

This may, or may not, help. Again it is a function of total station topology. If you have any interconnections between station equipment and the computer, such as a packet modem or the like, then you want the systems on common power. Getting on another leg of the power distribution will insure ground loops in this case.

>8. if you have the money by a Class A product (most of the clones are Class C)
>class A devices are the best.

This is wrong (for the USA at least). Class A products are permitted for industrial/commercial zoning and have a higher permitted radiation limit than Class B devices which are permitted for residential zoning. I'm not aware of a Class C rating for computers in the USA (European standards may be different). There is a third rating beyond Class B, however, and that is Tempest. This is primarily for certain secure computer systems, and is *very* well RF shielded.

An additional item, and the most important in most cases, needs to be addressed. That's *monitor* radiation. For HF, and often for VHF, interference, the monitor is the primary culprit. Most of today's computer monitors have plastic cases and no, or inadequate, internal shielding. Use of metal, metal mesh, or foils to shield the cabinets will yield large interference reductions. Alternately, use of special EMI conductive sprays on the plastic cabinets will often work. For shadow masked color tubes, no additional shielding will generally be required for the monitor face. But for monochrome tubes, or Trinitron type color tubes, some sort of tube face shielding will be required. Fine wire mesh, painted flat black, can be installed over the tube face if required. This will do dual duty as an RF shield and a glare shield.

Special attention needs to be taken with the monitor cabling. The video cable will have signal components from the lowest LF to the VHF spectrum, and the power cable will normally have surge currents corresponding to the horizontal sweep rate and its harmonics. These cables need to be well shielded and properly installed to prevent

leakage. Use of ferrites on cable shields will suppress common mode radiation leakage.

The final problem is the keyboard. Most keyboards are totally unshielded, and the key scan matrix can generate considerable interference. Ordinary shielding techniques will make the keyboard unusable, so different methods have to be used. Waveshaping of the scan matrix signals, and adequate decoupling capacitor use will go far to reduce keyboard EMI. Often, however, it's simply better to try several different keyboards and pick the one with the least noise generation. I've found the Focus 2001 brand to be particularly quiet, and to have good key feel and layout, so I've standardized on that one for all my PCs. Other keyboards may meet your needs better. Mice, too, can be interference generators. Again, trying several and picking the least obnoxious is usually the best course.

Gary

1032. Egg beater antennas useful for terres and sats???

Newsgroup: rec.radio.amateur.space
Date: 1995-05-13 00:00:00 UTC
From: rsmith@internetmci.com
Message-ID: <3p2oe0$c@news.internetmci.com>
Source record: 25034

Saw some lit on eggbeater antennas - could they be used for pacsat work - I have a problem - want to work the pacsats but I have antenna restrictions - could get those pups in my attic though.

Any help would be appreciated.

Eggbeater the answer for attic sat use??
Here's the story:

want to work PACSATS. DESPARATELY!

Live in a neighborhood with restrictions
Have lots of room in the attic (12' pitch!)
Not enough room for beams and rotors though.

Read a short spec in a catalogue on the eggbeater antenna -
Supposedly the thing for terres/space work.

Am I on the right track.
What else do you think I would need if they work.

My shack is in the basement of my house - about a 50' run.

any help would be appreciated.

thanks and 73, de Bob.

Source record: 25036

If you can get a dag spray paint that helps.
The modern all plastic monitor enclosures are completely transparent to
RF.
A dissipative coating on the inside of the monitor case can reduce the
RFI by many dB.
But it is a real problem that has not received sufficient attention.
You could always get an LCD display.

Worked 2M SSB mobile with an eggbeater 10-15 years ago along with Mike and Mel formerly of KLM. It is omni directional, horizontally polarized towards the horizon with circular polarization directly overhead. Some have placed a reflector below the loops to enhance LEO satellite operations. Essentially two "quad" loops, the antenna is very broadband so that attic mounting should not cause proximity detuning problems.

From: billh@gn2.getnet.com
Message-ID: <3p38dn$fle@infoman.net99.net>
Source record: 25040

I am running a PK232 and WISP on 1200B satellite. Works great as long as I go in with comm program 1st & set 232 to KISS mode. Prob then is that the MSPE module ALWAYS kicks the 232 out of KISS when it closes. I haven't figured a way to correct this and it raises hell during close together passes. Any ideas out there????

Bob Wilkins n6fri (rwilkins@ccnet.com) wrote:

: We have a similar group now. rec.radio.amateur.info

Hmmm...must have missed that one; will subscribe to it and check it out.

: How about rec.radio.marketplace for new product announcements

: Many of the other large collections of newsgroups have established the
: marketplace group for similar posts. It has been proved quite popular
: with readers, as well as the marketers. One stop shopping.

Either approach would be fine with me. Since there is already a .info
newsgroup, wouldn't it make more sense to simply direct advertisers to the
appropriate newsgroup, instead of wasting the bandwidth (and everyone's
time, surely a more valuable commodity) flaming these vendors? Of course,
there's still the problem of spamming the entire rec.radio.amateur.*
hierarchy.

From: "Lawrence F. Johnston" <ljohnsto@carbon.cudenver.edu>
Subject: DSP93

Anyone have any experience with or thoughts about the DSP93?

I have a Yaesu FT736 and would like to get on KO23 and KO25 and
have the flexibility for P3D.

I'd appreciate any helpful suggestions.

Subject: Egg beater antennas useful for terres and sats???

Saw some lit on eggbeater antennas - could they be used for
pacsat work - I have a problem - want to work the pacsats but I
have antenna restrictions - could get those pups in my attic
though.

Any help would be appreciated.

Subject: LOWEST RFI FROM WHAT COMPUTERS ?

In article <3ovg7r$jtt@taipeh.hl.siemens.de> wscad22@taipeh.hl.siemens.de writes:
>Almost all the computer make interference.
>Here are some tips that can help to reduce the interference of a computer
>
>1. The computer should be in a total clossed metal case
>most of the computer have a plastic front or case. trough this plastic the
>interference leaks out.

This is a good tip. All openings in the case need to be shielded. There
have to be openings for ventilation, but these should be covered with
metal mesh, similiar to the way any other RF equipment is handled. The
case seams need to be joined according to good RF practice. For VHF
suppression, that requires that the joining surfaces be paint free and
a screw should be used every 5 cm along the seam. Alternately, finger
stock can be used at seams. Removable media disk drive openings can
be a problem. Usually, the best course here is to install shielding
behind the drive bay and just suffer the interference when a floppy
is being written or read.

>2. The metal case of the computer must have a good ground connection
>if no ground connection is available try a radiator or make your own ground
>connection

This is not necesarily a good idea. Connection to Earth may or may not
improve interference suppression depending on the topology of the station
and computer installation. Frequently, connection to Earth will *worsen*
interference. You'll need to experiment with your particular layout to
see if this helps or not.

>3. All grounds should be connected at ONE point (make no ground-loops)

This is a good tip. Ground loops will insure mutual coupling of interference.

>4. Place a netfilter beteen the powernet and the power-supply-unit
>most computer power supplies bring a lot of interference on the power net of
>your building/group.

This is also a good tip. However, the filter needs to be bonded directly
to the computer chassis. Filters built into extension cords may or may not
help, and can sometimes make interference worse.

>5. Every connection out of your computer carries interfernece out of your
>computer
>if you have a modem it will increase the interference ot of the computer.
>All devices (if possible) should be places in the computer.
>Every line out of the computer works like a atenna.

This is generally true. However, use of internal modems and such can make
your computer more vulnerable to lightning damage. Properly installed and
connected, external modems can have as low an interference level, and offer
some lightning protection by keeping the telephone line surge suppressor's
return path off the computer chassis. Careful thought to Earth connections,
if any, can help here. Earthing the modem rather than the computer can
serve to keep surge return currents away from the more valuable computer.

>6. Don't place the computer to near to your receiver/transmitter.

Generally good advice. This will reduce cabinet to cabinet induced
radiation. However, proper shielding of *both* radio and computer
will allow them to be placed adjacent to each other without undue
interference.

>7. if you have different AC-groups in hour building place the computer on a
other
>AC-group.

This may, or may not, help. Again it is a function of total station
topology. If you have any interconnections between station equipment
and the computer, such as a packet modem or the like, then you want
the systems on common power. Getting on another leg of the power
distribution will insure ground loops in this case.

>8. if you have the money by a Class A product (most of the clones are Class C)
>class A devices are the best.

This is wrong (for the USA at least). Class A products are permitted for industrial/commercial zoning and have a higher permitted radiation limit than Class B devices which are permitted for residential zoning. I'm not aware of a Class C rating for computers in the USA (European standards may be different). There is a third rating beyond Class B, however, and that is Tempest. This is primarily for certain secure computer systems, and is *very* well RF shielded.

An additional item, and the most important in most cases, needs to be addressed. That's *monitor* radiation. For HF, and often for VHF, interference, the monitor is the primary culprit. Most of today's computer monitors have plastic cases and no, or inadequate, internal shielding. Use of metal, metal mesh, or foils to shield the cabinets will yield large interference reductions. Alternately, use of special EMI conductive sprays on the plastic cabinets will often work. For shadow masked color tubes, no additional shielding will generally be required for the monitor face. But for monochrome tubes, or Trinitron type color tubes, some sort of tube face shielding will be required. Fine wire mesh, painted flat black, can be installed over the tube face if required. This will do dual duty as an RF shield and a glare shield.

Special attention needs to be taken with the monitor cabling. The video cable will have signal components from the lowest LF to the VHF spectrum, and the power cable will normally have surge currents corresponding to the horizontal sweep rate and its harmonics. These cables need to be well shielded and properly installed to prevent leakage. Use of ferrites on cable shields will suppress common mode radiation leakage.

The final problem is the keyboard. Most keyboards are totally unshielded, and the key scan matrix can generate considerable interference. Ordinary shielding techniques will make the keyboard unusable, so different methods have to be used. Waveshaping of the scan matrix signals, and adequate decoupling capacitor use will go far to reduce keyboard EMI. Often, however, it's simply better to try several different keyboards and pick the one with the least noise generation. I've found the Focus 2001 brand to be particularly quiet, and to have good key feel and layout, so I've standardized on that one for all my PCs. Other keyboards may meet your needs better. Mice, too, can be interference generators. Again, trying several and picking the least obnoxious is usually the best course.

Thanks, I got a bunch of stuff and heard Mir 3 times today cos of it!! I'll work 'em as soon as they start talking!

BTW, just a random note for newbies out there... when I downloaded the elements, I tried to look at them on my PC and they were not at all lined up with the edges of the screen. I was worried, but QuikTrak sorted it out just fine. Just wanted to pass that along and keep someone else from worrying like I did!

From: Steve Murdock <murdock@graceland.edu>
Subject: RS-12

I made my first contacts the other morning on RS-12(mode k) and was thrilled to death, but I have a couple of questions about procedures.
(1) does one put any special info on a satalite QSL card?
(2) does one tune the trx or rcv or both to compensate for doppler shift when calling CQ? or does doppler affect both trx and recieve frequencies the same so that no compensation is called for?
(3) If I hear a CQ on say 29.430 and I think doppler should be abt +2.5 kHz, do I add 2.5 to my trx frequency in hopes that I will be heard?

Any suggestions will be welcome, E-Mail or posts if its of general interest.

Tnx

If you're getting RFI from your monitor, check the background pattern you're
using on the screen- the worst case rfi generating pattern is a grey background
made up from alternating black and white dots- all guns on and all guns
off, switching everything as fast as you possibly can. This is one of the
patterns
we use for rfi testing. Go for a solid color to minimise emissions from the
video portions of the display. The horizontal width link can also be a strong

magnetic radiator if it's unshielded- high currents are present.

Perhaps take a look at the antenna of VE1COR as detailed in his
June [1995] QST article, Exploring the 9600 Baud PacSats...

VE1COR uses a fixed elevation log periodic antenna. The antenna has
a relatively wide vertical beamwidth. I would'nt have believed
that was his antenna [until I saw the article] as he seems to be
in the broadcast queue consistently on KO-23! I just saw him on
the last pass. This might fit in your attic space.

Don't compromise on a good pre-amp mounted right at the antenna
in your attic.

One other possible option...Although I don't live in an antenna
restricted neighborhood, when I first set up my sat station a
few years ago, I built the antennas [14 elements on 145 mhz
18 elements on 435 mhz] circular polarized yagis, with az-el rotor,
and recive preamps on the mast and mounted everything on a tripod
in my garage. I wanted to make sure everything worked prior to
taking that HUGE configuration up on the roof.

After I got everything together and tested, I decided to give it a
whirl, from the ground. I carried the tripod with antennas out into
the driveway, pointed the thing north, then gave it a shot. It
worked great. In fact for the next several days I dragged the whole
array into and out of the garage as time allowed [I've got pictures
to prove it!].

As I mentioned my 'strange' operating arrangement on the air
you would'nt believe
how many hams I talked to who worked that way on a permanent basis!

While it wouldn't be easy, the moral of the story is, where there is a will...there is a way.

Good luck getting on the PacSats, it is great fun and I hope to hear from you soon on the birds!

Jeff -

Of those 7,000 newsgroups, how many are totally bogus and mostly or
totally unused, such as:

alt.brian.saunders.pot.kettle.black
the whole alt.bonehead heirarchy
alt.bubba-love.el-caminoville
alt.bruce.it.was.just.an.accident
alt.butt-keg.marmalade
alt.cancel.bots
alt.check.her.miss-jesus
alt.choad

etc., etc. This list could go on and on. I'm really curious as to how
these newsgroups got started. They certainly don't serve a purpose
because nobody ever uses most of them and their names are totally wierd.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1051. [long] Peculiar Carrier Doppler Shift from KO-25 ?? Why ??

Newsgroup: rec.radio.amateur.space
Date: 1995-05-15 00:00:00 UTC
From: lsn92@ecs.soton.ac.uk
Message-ID: <3p62qa$sdk@turner.ecs.soton.ac.uk>
Source record: 25053
Cross-posted to: rec.radio.amateur.space,uk.radio.amateur

I observed somewhat peculiar Doppler Shift of the carrier from KO-25, whose centre frequency I knew to be 435.600 MHz.

I used a YAESU FT-736R and a computer, both connected via serial port, as an Automaitc Carrier Frequency Measuring Tool. The FT-736R returns an FM Discriminator Meter value which is proportional to the Tuner Frequency and Incoming Carrier Frequency. The computer then correct the Tuner Frequency according to the FM Disc Meter value. The accuracy is about 300 Hz.

I used both Quick Track 4.0 and Manfred Bester's Sattrack 3.0 to predict the Doppler Shift of KO-25. They agreed well within 1 kHz.

I attach my one of my latest log file with this post below. To my amazement, the Measured Doppler Shift and the Predicted values deviated with a certain pattern. The deviation (Prediction-Measurement) increased steadily and peaked at 9 kHz !! Then it decreased steadily.

I have not much problem with KO-23 and UO-22, transmitting FM at 435.175 MHz and 435.120 MHz respectively. The prediction-measurement deviation is more or less constant below 1 kHz.

I have tried different TLE sets for prediction. They gave similar results.

What could be the reason? Are the carrier frequencies I quoted correct? Has anyone made a similar observation?

Please reply to my email account.

Thanks for your attention and advice.

Yours,
L S Ng

1052. Help with TrakSat 2.80 on 286-*Mhz

Newsgroup: rec.radio.amateur.space
Date: 1995-05-15 00:00:00 UTC
From: eew4aql@prism.gatech.edu
Message-ID: <3p8cp3$7jq@acmex.gatech.edu>
Source record: 25054

Hello!!

I have a couple of questions about TrakSat 2.80. I am running it on a Tandy 1000 TL/2 (yeah, I know.. it was free :-) with a 286 processor at 8Hz. It has a CGA monitor. My questions:

1) When I run it, the default mode is to turn the Land Color ON. This produces nothing but an all-white screen while in ground-track mode. If I turn it OFF, it's ok, but justwhite on black. Is there a reason I can't get the color to work?? The menu screens are in color, I have changed the color in the first line of the settings file, and it hasn't changed the situation.

1A) Can I set the land color switch to default to OFF (No) or do I have to do it manually every time I run it??

2) I have used another program, I think it was called QuikSat or SatTrak. I can't seem to find them on the local BBS's. Has anyone out there done a comparison of all the tracking programs, listing pros and cons of each?? TrakSat isn't that bad, but I would like to have AOS and LOS countdowns.

Thanks for the help!! Reply to mwhaley@iu.net please! :-)

The Clear Lake Amatuer Radio Club NOSTS-2 Balloon Flight - de W5SXD
---

13 May 1995, Sugar Land, Texas

The Clear Lake Amatuer Radio Club (CLARC) launched their second balloon in the Near Outer Space Transportation System (NOSTS) series today from Wharton, Texas, about 50 miles west of Houston.

Project leaders, John Maca, AB5SS, and Dan Feeback, KJ5MX, and others burned the midnight oil for several weeks prior to the launch preparing for a great Saturday of amatuer activity. The CLARC group and many other local hams arrived in Wharton early Saturday morning after the weather was declared acceptable for a launch. Last minute tweaking and adjusting took most of the morning.

The balloon was ready to go shortly after one PM and the FAA gave launch approval for 3:30 PM. While several of the experiments had last minute problems, the GPS packet radio subsystem worked quite well, reporting the package position and allowing hams in the southeast part of Texas to use the digipeater. The GPS downlink was linked into several ground systems including APRS. Many APRS mobile units were employed, relaying through the balloon born system. Several stations used the DeLorme Map Expert package and during the recovery, and the local ATV repeater was showing street maps uplinked by John, WB5CHV, around the area in Pasadena, Texas where the balloon package landed. The local fox hunt folks and the GPS system produced good results in the recovery, locating the package within several hundred feet.

The package reached an estimated altitude of about 100,000 feet. Unfortunately, the GPS data clamped altitude at 60,000 feet, so for a while, the real position was not known. But after the ballon burst, and the altitude came back down below 60,000 feet, the GPS led the recovery team to the package. The parachute and attached package hit a power line and the package fell to the ground. A passing local resident picked up the package, put it into his van, and drove about a half mile to his house. He took the package inside his house but, since the GPS system was still operating, the recovery team located it within

an hour.

The tracking system here at W5SXD worked well, reading the GPS messages from the package, calculating elevation, azimuth, and range to 12 cities in the area and then sending status packets back through the digipeater in the package. A complete log of all this packet activity has been uploaded to various sites as NOSTS2.zip.

The GPS system consisted of a Motorola PVT6 GPS engine driving a Kantronics KPC-3. In a conversation with Tom Clark, W3IWI, it was determined that the particular PVT6 may not have had the correct version software. The version flown had a software government imposed limit of 60,000 feet. Newer software versions are said to have had this limit removed so anyone planning on flying this engine should check their version.

The Houston Balloon Launch Team led by Andy MacAllister, WA5ZIB, who are planning the launch of their tenth package, BLT-10, on 15 July 1995, were present at the launch in force. They enjoyed being spectators and took lots of notes that will be helpful in their flight. They are planning a similar GPS subsystem so the NOSTS-2 flight provided a good test run for tracking and recovery methods. Stay tuned ...

This is addressed to the individual who posted a list of repeaters that carry the audio and/or video of NASA coverage of shuttle missions. The listing was signed "John Chapman, WB8INY". This list is very out-of-date. You might query the net to compile an updated list. Here is some corrections:

1056. Modulation schemes in use?

Newsgroup: rec.radio.amateur.space
Date: 1995-05-16 00:00:00 UTC
From: edsuom@u.washington.edu
Message-ID: <3pbb2d$1qi@nntp4.u.washington.edu>
Source record: 25058

I am interested in knowing what digital modulation schemes are currently being used, especially on 2M and 440Mhz, in order of expected popularity. If anyone has any references describing these schemes and can give me a feel for what schemes are expected to dominate in the next few years, I'd appreciate it. For example, is quadrature phase shift keying being used, or just FSK?

All my hamming was CW and SSB - I never got into packet, but now I need to know a little more about it.

Tnx,

Ed NM7T

1058. DOVE: quick description please???

Newsgroup: rec.radio.amateur.space
Date: 1995-05-16 00:00:00 UTC
From: eew4aql@prism.gatech.edu
Message-ID: <3pbnp9$qe9@acmex.gatech.edu>
Source record: 25060

hello folks:

Seems that I always used to see info posted here (or somewhere) about a satellite called DOVE. Is this the same as OSCAR 21 (Informator 1??)?

Could someone post it's name, frequencies (2m/440 esp.) and perhaps a brief description of what it is/does? (I seem to remember that it wasn't designed to receive, just transmit bulletins or something.) Thanks for any help!

Please reply to mwhaley@iu.net :-)

1059. FT736R Computer Interface & Control

Newsgroup: rec.radio.amateur.space
Date: 1995-05-16 00:00:00 UTC
From: durham@lobby.ti.com
Message-ID: <3pan08$2v6@superb.csc.ti.com>
Source record: 25061

I bought a cable and connector interface with software for $49.95 that
is supposed to provide for controling the FT736 from the serial port of
a computer. The cable and connectors look OK, but the software only lists
a set of programs that the author intended to write someday. There was
software for Kenwood and Icom and some unfinished software for an HF rig
built by Yaesu (FT757 maybe.)

Does anyone know of a complete working program for use with the FT736? All info
to date has led to dead ends.

Mike:
DOVE stands for Digital Orbiting Voice Encoder... it's orginal
purpose was to transmit voice messages that could be easily received
for educational purposes. Unfortunately the voice experiment has not
worked very well and is still being debugged. DOVE is listed in the
keplerian element sources as DO-17. The satellite itself is a
microsat,in the shape of a cube, measuring I think 9 inches on a side.
DOVE telemetry is broadcast via 1200 baud FSK packet (same as most
common earth bound packet setups). The telemetry may be found on a
frequency of 145.825 Mhz FM. I use a pretty basic packet setup, with
a groundplane antenna about 30 feet high, and have no trouble
copying the telemetry. I have also copyed the signal successfully
on an HT with the rubber duck antenna, but obviously not as well.
You will need a decoder program to turn the telemetry into
understandable data. If you use the decoder program,
the data will include all sorts of interesting information about
power levels, temperatures, voltages and currents in the electronics.
One of the most interesting data points to me is the transmitter

output power, which generally runs in the 20-26 MILLIWATT range.
This is about the output power of a toy walkie talkie!
Hope this information is of some use ...

DOVE

DOVE is short for Digital Orbiting Voice Encoder and is a transmit-only hamsat (it has no user accessible receiver). Built in Argentina, DOVE was launched in 1990 as a good will satellite to introduce children and newcomers
to amateur satellites. It was originally intened to transmit digitized voice
messages that could be picked up by students with simple receivers. Unfortunately, the digital voice hardware and software has been a constant source of problems since launch. Atempts to get DOVE to works properly are
proceeding as this is written, so the best bet is to tune your 2-meter rig or
scanner to 145.825 MHz and see what the bird is up to currently. Be ready for Morse, standard 1200 baud packet or (with luck) digitized voice messages.
The signals are strong enough so that an HT with a rubber duck will hear it
when it's overhead, although ground plane antennas will give better coverage
when the bird is near the horizon.

[info and long log mercifully trimmed]

At a guess, your computer clock was a couple of minutes or so fast.
If you time shift the observed doppler shift by 116 seconds it fits
the predicted one quite well.

> Please reply to my email account.

No. If you can't be bothered to read the group, don't ask questions
on it. Nettiquette-101.

1063. AO-13 pointing angle

Newsgroup: rec.radio.amateur.space
Date: 1995-05-17 00:00:00 UTC
From: kinzer@dtsdev0.sps.mot.com
Message-ID: <3pd7qo$1lt3@newsgate.sps.mot.com>
Source record: 24965

I managed to get SatTrack going here, and it has a provision to calculate the antenna off-pointing (aka squint) angle. I need to find the spacecraft attitude information. Can anyone help me here?

Also, I would like to get the current mode data. I already have the next schedule (May 22 on,) but I would like to figure out why my signal level (or the beacon for that matter) is so variable at this time (other than the fact that I haven't built a reasonable downlink antenna yet. ;^)) Anyone with a pointer to where I can find the current data?

Thanks!

-dave

You have to understand the difference between the Usenet Big 8 and
other hierarchies, specifically alt.

Here we have votes to determine before group creation if there's
enough interest, and an individual (tale) to send newgroup messages
that will be honored automatically.

In alt, there are no votes, anyone can send a newgroup message, and
any site can choose to honor it or not.

Nobody's BOUND by Tale, here, but I guarantee you a new rec group
will get at least 50% propagation, especially if it's part of an
existing subgroup such as rec.radio.amateur. A new alt group will
be extremely lucky to get 35-40% propagation.

And the more silly alt groups that get created, the more this
divergence occurs.

The flip side is that the big commercial sites (e.g. AOL, Prodigy,
Netcom <g>) newgroup practically everything that comes down the pike,
so that a large percentage of Usenet readers do have access despite
low propagation.

Thanks for the e-mail guys. The program recommended by all is NOVA or
NOVA 1.0. NOVA is supposedly available from W9IP at 315-379-9669. I tried
leaving two messages at that number and have not received a response yet.
NOVA 1.0 is by Northern Lights Software (probably W9IP) but I don't have
a phone number for them. If anyone can tell me how to obtain these (this?)
programs, please e-mail me or post it.

I received an unidentified multi-page incoded program that I
couldn't figure out how to decode (uuencode or wincode wouldn't work.)
It must have been some kind of rig control program, but didn't get any info
with it.

I need to know the minimum
>crossboom length I can get away with.>Greg, KN4NO

Greg, if you get a lot of responses to this they are all going to be
different. The minimum crossboom length is going to depend on how much
eccentricity in the circular polarization you can tolerate. The 2M ant
is the one that will be affected first since the wavelength is greater
at 2M and the spacing required to minimize circular distortion is greater.
About seven feet spacing may be acceptable to you under the circumstances.

Good Luck, Ken Durham K5MBV durham@lobby.ti.com

: 5.How does it stack up against the 736R preformance wise.
: Thanks for any help I really want to get started in
: Oscar sats. and hope this rig will do.
:

Most of your questions have been correctly answered by other posters.
A few comments:
Not all 726's are equipped for full duplex...there is a "satellite" option.
There are two different 70 cm modules, one does the 430 MHz portion
of the band (for SSB) and the other does the 440 MHz portion (for FM), oh, U.S. bias
plainly showing here.
Modules are options are getting harder to find, so make sure the
726 has everything you need.

Actually DOVE is a Brazilian satellite - not Argentinian. Dr. Junior de Castro PY2BJO is the control operator and it has a call sign of PT2PAZ.

LUSAT (LO-19) was an Argentinian satellite launched at the same time as DOVE. In addition two more microsats, PACSAT (AO-16) and WEBERSAT (WO-18) were launched on the same vehicle with all four satellites sharing the same basic microsat bus. (Webersat is a bit taller to support its camera experiment). Two UOSATs were launched with the Microsats in February 1990.

The DOVE satellite primarily transmits on 145.825. It transmits
standard packet that you can recieve with a normal packet TNC. I have
written a program that decodes this data. If you are interested you
can get a copy of this program from:

ftp.amsat.org /amsat/software/windows/telemetry/dovedv12.zip

Yes, it is considered legal. If you get a copy of The Satellite Experimenters Handbook, you will find a discussion of license class vs satellite bands and operation. There is also some very good technical information in this book. Joining AMSAT and getting the freebies that come with initial membership is the best deal you can find if you are going to operate the satellites.

A GENERAL RELATIVITY PARADOX

My brother and I were recently discussing a paradox in general relativity. An astronaut drops a small source of monochromatic light pulses into a black hole. This device emits flashes at millisecond intervals. The astronaut (thanks to rockets) maintains his distance from the black hole, but the flasher freefalls inward.

As the flasher approaches the event horizon, the astronaut observes that it marks time ever more slowly, compared to his own wristwatch. The frequency of the light from the flasher is observed to become increasingly redshifted. Asymptotically, the (astronaut observed) distance between the flasher and the event horizon approaches zero. Also asymptotically, the (astronaut observed) frequency of the pulses approaches zero--i.e., the photon energy is being redded to nothing and the interval between the flashes is being raised to infinity, in the astronaut's reference frame.

However long the astronaut waits and watches, the flasher never quite crosses the event horizon and the flashes never quite reach zero frequency. Those events (flasher crossing the event horizon, freqency redded out) occur at a time T=infinity with respect to the astronaut.

On the other hand, the black hole will evaporate due to quantum processes--the Hawking radiation--in some time less than infinity (albeit very large). The astronaut (if he lives long enough) will observe the black hole's evaporation, but he will not observe the flasher pass the event horizon.

Since the same events must occur both in the reference frame of the astronaut and in that of the flasher, does the flasher ever pass through the event horizon in ANY reference frame (including its own)? Wouldn't an observer falling with the flasher observe the event horizon falling away from him under the evaporation caused by the Hawking

radiation? Yes, no, why? All thoughtful replies welcome.

{I include .space since it's likely to have UHF folks...}

At Dayton, I heard mention of PD/shareware that does path planning for UHF/uwave links.

Anyone seen same?

oops, based on my affairs (is that the right word?) with a student from middlesboro
.ac who had been at a couple of other .acs beforehand. Obvioisly not universally
correct :-)

1085. Latest Kepler data

Newsgroup: rec.radio.amateur.space
Date: 1995-05-19 00:00:00 UTC
From: speedy@news.cosy.sbg.ac.at
Message-ID: <3pibe4$1fd@esel.cosy.sbg.ac.at>
Source record: 24987

Hi folks,

I'm looking for an online site (www/ftp/whatever) where I can always
get the most recent kepler data from.

Does anybody know where I can get those ?

Thank you and 73 de Peter (OE2PBP)

1086. Computer Control of Satellite Radio With Tracking Program

Newsgroup: rec.radio.amateur.space
Date: 1995-05-19 00:00:00 UTC
From: durham@lobby.ti.com
Message-ID: <3pic1o$o09@superb.csc.ti.com>
Source record: 24988

I have been looking for software to control my Yaesu FT736R by computer
for some time with no success. Last night I was called by Michael Owen
who wrote NOVA, which is a tracking Program with rig and antenna control
through the popular tracking hardware systems. He e-mailed a description
with a list of features today.

The software works with Icom, Kenwood, and Yaesu radios.

If anyone else is interested, his e-mail address is: mowe@slumus.stlaw.edu
The phone number is (315) 379-0161.

The call and information is in a roundabout way, a response to my post in this
usegroup. Thanks for the help guys.

1087. New SatPasses Web Page

Newsgroup: rec.radio.amateur.space
Date: 1995-05-19 00:00:00 UTC
From: manfred@ssl.berkeley.edu
Message-ID: <3pilnv$6p6@agate.berkeley.edu>
Source record: 24989
Cross-posted to: rec.radio.amateur.space,sci.space.shuttle,sci.space

This Web page will allow users to determine when certain selected
spacecraft will be in range for visual observations or for radio
communications.

Data are presently provided in tabular form for 36 major cities in the
United States and for four different satellites: the current or upcoming
Space Shuttle Mission, the Russian Space Station Mir, HST and UARS.
The predictions are calculated every night for 6 days in advance.

The URL is:

http://ssl.berkeley.edu/isi_www/satpasses.html

Suggestions are most certainly welcome.

Enjoy,

Manfred Bester

Yes. The Technician license class gives full access to all frequencies allo-
cated to amateurs above 30MHz, which means the 6 meter band and everything
up.

Trust me tho, you still will probably want to do the code... I'm getting a
bit bored stuck up on the high bands. :-)

Try the Air Force Inst. of Technology FTP site:

archive.afit.af.mil (login as anonymous, you e-mail address as password.)

it's in the directory /pub/space . Look for files that end in .tle, such as
mir.tle, amateur.tle, visual.tle, etc. It seems to be updated very frequently.

=========
SpaceNews
=========

MONDAY MAY 22, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* STUDENT WXSAT PROJECT *
========================
Four students of the Pavillon d'Ordinique of Lionel-Groulx college, in Ste-Therese, Quebec, Canada, were among the participants at an exhibition featuring end-of-session projects in Computer Systems Technology (TSO), on May 12th. Martin Rainville, Nathalie Caron, Jason Dumais and Paul-Andre Laroche VE2PLP designed and constructed a weather satellite VHF APT receiving station. They designed the control systems and software for the az-el rotors and the receiving and decoding equipment necessary for the project. Paul-Andre is a licensed amateur, and Jason Dumais holds an amateur certificate but has not yet applied for a callsign.

The Pavillon d'Ordinique has its own amateur radio station, VE2IOQ, which is well equipped for satellite work, with a Yaesu FT-736R transceiver, and a set of 2m/70cm OSCAR antennas turned with a Yaesu G5400 az-el rotor. The club at the college is sponsored by the Club Radio Amateur Laval Laurentides, which promotes satellite and space communications.

[Info via Mike, VE2TRV]

* FO-20 NEWS *
==============
James Tudehope, KL7QR reports having some success working FO-20 on Mode A from Valdez, Alaska to Tokyo, Japan this past week. He worked JN1GKZ, JK1DVX, and JK1EXF all on FO-20 at 01:20 GMT 5/14/95. Signals were excellent, peaking at 5x5.

James likes to operate on a downlink frequency of 435.850 MHz. On several passes, he noticed that he is the only one on the transponder. He only started working FO-20 the week before last, and it has become his favorite

LEO satellite because the signals are so clear from this bird.

[Info via James Tudehope, KL7QR]

* MIR NEWS *
============
G. Miles Mann, WF1F, reports that the current crew on Mir is getting the hang of the 2 meter transceiver and the packet radio Personal Mail System. Norman has been answering packet messages as fast as time allows.

Many Amateur Radio stations have learned the correct procedure for connecting to the Mir PMS. But unfortunately, there are many others who do not understand procedure for connection to Mir. The PMS on Mir can only connect to one (1) station at a time, and it only takes one station operating improperly to ruin a whole pass for everyone in North America. If you happen to find one of these stations please pass on the correct information or direct them to back issues of SpaceNews or QST.

The Keyboard port (R0MIR) is not used often. Unless there is a crew member actively typing on this port, you should NOT connect to the Keyboard port. Don't be fooled by the CQ message coming from the R0MIR port

R0MIR>CQ <UI>:

Anyting you send to the R0MIR port is not saved and just causes interference to people using the Mail port (R0MIR-1).

Stations attempting to connect to Mir should make sure the TNC parameter MCON is turned ON. Look for the packet message:

R0MIR-1>CQ <UI>:

before you call Mir! If you do not know how to read a packet string, then maybe should not try to call Mir until you study a little more. If you see a string with an Index number:

R0MIR-1>xx1xxx <I0 or I1,I2,...I7>:

Immediately abort any attempt to connect the Mir PMS, and wait until you see the <UI> packet.

QSL Information:
Norman said he is logging all voice contacts, and will bring the log back to earth next month. Most packet contacts are not logged, because there are three people using this PMS. Packet messages are read and deleted, but are not logged. It may not be possible to get a QSL card for a packet contact with Norman.

For those who made contact with Norman, his QSL address is:

Norman E. Thagard
Mail Code CB
Johnson Space Center
Houston, Texas 77058

[Info via WF1F]

* MIR TRAFFIC *
===============
Dave, N1PPP, has been in contact with Norm and the cosmonauts on Mir recently using Mir's packet radio personal message system. During a recent exchange, Dave asked how Norm enjoyed living in space as opposed to simply visiting as he did on his previous space missions. Norm's response was:

Stat : PR
Posted : 95/05/15 22:58
To : N1PPP
From : R0MIR
@ BBS :
BID :
Subject: hello

Well, I am truly living in space this time as opposed to just visiting on my previous four flights. Not only that, I got to ride on a Russian rocket, something no other American has done. Volodya, Gennady, and I, I believe, will land in a different country and on a different continent from the one we launched. I even had to turn in my unused return airline ticket from Moscow to Houston. Delta probably was disappointed about that. Best wishes from Norm and the Mir 18 Crew

Norm had the following to say on the subject of aurorae:

Stat : PR
Posted : 95/05/14 19:21
To : N1PPP
From : R0MIR
@ BBS :
BID :
Subject: Aurora

The Aurorae (Borealis and Australis) are plasmas which stream toward the Poles. They can be seen and are sometimes studied from space. During my second flight in 1985, we had an experiment involving photography of the Aurorae. To reflect solar activity, that can be indicators of altered ionospheric conditions which do affect radio transmission.
Norm and the MIR 18 crew

Dave, N6JLH has also been keeping in touch with the Mir 18 crew via Amateur Packet Radio. In a recent exchange, Norm Thagard reported on the success of a recent spacewalk outside the Mir complex:

Stat : PR
Posted : 95/05/12 20:19
To : N6JLH
From : R0MIR
@ BBS :
BID :
Subject: News

First of four planned EVA's took place today. Seemed successful although some question about the way the solar battery retracted. Only first three sections of the battery were planned to be folded today. Remaining sections should the battery will be re-installed on the KVANT module. I took some good video. Maybe some of it will be shown on the news.

Thanks,

Norm and the MIR 18 crew

This isn't graffiti; it's INFORMATION. Information I want to know about
without reading every damn newsgroup known to man.

I live in this neighborhood, too, and I want to hear about new products
like this one. So don't stop posting.

>This graffitti should be seen in rec.radio.swap where there is no
>confusion about the commercial nature of the offer.

See above.

All you self-appointed arbiters of good taste waste more bandwidth whining
than some of the worst spammers!

Just use a filter or an agent or something if you don't want to know
about new products. You can program your reader to just pass whiney-assed
complaints about posting "commercial" info, then you'll be happy as
a(n uninformed) clam.

Ken,

Bob Myers Communications is a distributor for NOVA 1.0. His number
is 602-837-6492. Fax is 602-837-6872.

The program is quite nice, the core program being a satellite
tracking program. But the interface for the 736R is done very well
with numerous memory channel setups, scanning, automatic scripts,
etc. I have been using it since its release at this years Dayton
Hamvention and I am quite pleased with its performance.

73 es Good Luck!

Is it possible to send a message from an Internet site to a satellite? Has this ever been proposed? It would seem that with certain restrictions in place that the folks who send messages to each other via satellite should be able to enjoy messages from Internet EMail.

What is the current situation and what is planned?

1098. Re: Need help with mode B crossboom length

gsnellgr@scsn.net (Greg Snellgrove) wrote:
>I am putting together a mode antenna array and I need to know the minimum
>crossboom length I can get away with.

Greg,

I have experimented with the boom length but there are numerous
variables. For instance, what antennas will you be using and what
kind of radio will you use, how much uplink power?

I have found that the closer the two antennas are together the more
interference your uplink will create for your downlink (remember you will
be operating full-duplex).

Presently, I use the KLM "short" antennas (14 elements on 145 mhz, 18
elements on 435 mhz) and about 6' is as close as I can get them. The boom
should be non-conductive (like fiberglass or wood). I use a Yaesu FT-736R
transceiver and usually run about 75 watts.

Thru other discussions it has been noted that 'skewing' the yagis can
help this cross-modulation problem. Instead of mounting the yagis
perfectly in the + direction, you can tilt them in the X configuration.
This did NOT seem to allow me to get closer than 6' but others have
claimed it helps.

Good luck with your mode B station and I hope to see you on the birds!

S T R A W B E R R Y M A N T R A R E C O R D S

To get zines distributed, Email us at the Email address below with a sample article and a description of the zine, or maybe even the whole zine, so we can make sure we want to distribute it, and if we say kuul, then send us some copies of the zine and yr in the catalog.
To get yr tapes distributed-Be good, and have nice sound quality. Send a good-sounding master tape and a master cover we can make black and white copies from to the address at the bottom. If you don't send a master cover, we'll just make one. Don't expect great artwork. John's taking drawing class.
We'll see what he can do. At least send a song list. The more you rock, the better. No Extreme-Hole Hearted Mr. Big shlock rock, please. We don't want Country or Offspring or Contemporary or R & B or Reggae or Rap tapes. So don't send them to us. If we don't like them, we put them away. Have any or all (?) of the following elements in yr music: rock, catchy rock, punk, or hardcore. Don't be lame, and, like we said, have nice sound quality.

Our royalty policy is real simple: When we distribute you, for each copy of the album you sell through us, (whether it's on vinyl or tape or cd) you get a dollar. Our royalty policy on zines is simple, too. You keep 70% of the money, we keep 30% of the money. If we (as in you and us) decide yr zine will be two dollars, we keep 60 cents for each sold zine. (60 cents just about covers postage costs. the zine department is really non-profit) The remaining $1.40 is yours! Because of this policy, we don't buy wholesale copies of zines in advance. mainly cos it's risky to us and yr zine gets more money this way.

*Online Zines: Don't wanna wait for snail mail to bring the zine to you?
Kuul! We'll Email it to you. Just send the money to the label address telling what zine you want and where we Email the zine to so you can download

it-and
the zine will be yours within seconds of receiving the money via a
download
file. Available when the catalog specifies "Online Version." Some zines
are
available Online only, some only by mail, some both. The royalty policies
for
Online Zines remain the same. (yes, postage costs don't exist when you
send
online zines, but really, it's not fair to the non-online zines. Some of
those zines have pictures and stuff, especially art/comic-type zines,
which
would be way impossible to do online. They don't have the advantage of not
paying for copying costs and postage. Just cos they have pix doesn't mean
they should lose money.)

SoundClips from Strawberry Mantra Records. Download 20-45 second long
samples as Wave Files from Strawberry Mantra releases.

Email the screen name below to request a SoundClip. I M P O R T A N
T!!!-Must
have a sound card to play these things. If you need help, after getting yr
clip, email me, i'll do what i can. Realize that mucho sound quality has
to
be sacrificed to make SoundClips possible, and that SoundClips do not at
ALL
represent the sound quality of Strawberry Mantra releases. If AOL said
"Welcome" when you signed on, then you probably, (unless yr sound runs
through that internal PC speaker that the modem noise comes through) can
play
these things.

All prices include tax and shipping and handling.

If you run a little label yrself, contact us. We'll trade tapes and
stuff.
We make sure the sound quality is nice on our releases. And, to smaller
bands, four-track recordings are just fine. There's a lot you can do with
four track recordings to make them sound really nice. We focus on the
music.
That's why we give the bands the extra money, to bring out new material.
It's
really money out of our pockets. But we're nice. We just want to make sure
we
don't make ourselves look bad by releasing poor-quality recordings. That's
all we ask. So talk to us! See ya later.
From John Mulhausen and Andrew Bales-Owners

Email SbryMantra@aol.com
Send zines, tapes and orders (cheks payable to John Mulhausen) to:
Strawberry Mantra Records
P.O. Box 701805

Tulsa, OK 74170-1805

COMING SOON
about 20 new albums are scheduled to be sent to us
The Video- a VHS tape w/ atticus finch, john, and others live. sketches, and
behind the scenes looks at kitty vamp and strawberry mantra records. probably
will cost 7 bux
Psychedelicatessen- Strawberry Mantra is putting together a compilation that
will be sent to 14 eager radio stations. (scary) and will include at least one
song from every band we distribute. (cept the ones on the kitty vamp
compilation, of course) and if yr on the label yr on the comp. and it's going
to 12 radio stations who happen to be rather interested in us. scary....
zines galore. zines zines zines
tell me right now if you want to be updated. we're gonna bring out good
stuff, but give us a second, the label is as of now, about 2 weeks old.

1100. ARTOB planned

Newsgroup: rec.radio.amateur.space
Date: 1995-05-21 00:00:00 UTC
From: welp@uni-muenster.de
Message-ID: <3poj3k$1uai@majestix.uni-muenster.de>
Source record: 25002

(This article does not reflect satellite communication, but I think hams who read this news group are a bit more interested in experiments like others...!)

To anybody who might be interested in:

We (local ham radio club in Muenster, NW-Germany) are about to start an amateur radio carrying ballon.

1st Flight:
Depending on weather - one of the next weekends (May or June 1995) - always on a Sunday afternoon (abt 12:00 UTC)

Place:
near Muenster, Germany, JO32pc

Flight hight:
up to 6000 ft

Call:
DL0ART/am

Frequencies:(1st flight)
2 m (probably 145.200): Telemetrics and call
10 m : only for ground control commands - receiving

That first flight is only for testing - no QSOs will be possible via this ARTOB. What's new on this flight compared to the flights in the 70s: We plan to achieve a controlled landing by a radio controlled deflating of the balloon - now blowing and dropping!

We would like to receive your reception reports and any comments, suggestions and so.

Our further plans are:
Translater for CW and SSB from 70 cm to 2 m.
More telemetric inormation available for anyone who is interested.
Video camera transmission on 10 GHz.

If you would like to watch our experiments or hear the balloon's sigs, I will be glad to inform you about every start we plan. We decide about a start on Friday night, and I will forward a mail to anyone who's interested. Just subscribe by sending a short mail to my E-mail-address (see below). Of course, reception of the balloon's sigs will only be possible in NW Germany (1st flight) or middle Europe (following flights), But also mails from other hams are welcome. We gladly will provide you with our experience made on the flights...

So, like how do you think internet messages from North America get to
places like Asia, Australia, Europe, etc.? Think all of them are going by
undersea cable?

You're already using satellites, dude, and just didn't know it!

Hi Oliver!

> (This article does not reflect satellite communication, but I think hams who
> read this news group are a bit more interested in experiments like others...!)
Don't worry, this newsgroup is frequently used to announce amateur radio
balloon flights. From my perspective at elevation 150 meters above sea
level, a balloon and a satellite are both very far up :-)

> We (local ham radio club in Muenster, NW-Germany) are about to start an
> amateur radio carrying ballon.
Good luck! Keep us informed of this flight and others in the future!

1103. Two-Line Orbital Element Sets (TLE609)

Newsgroup: rec.radio.amateur.space
Date: 1995-05-22 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.801179281@dolphin>
Source record: 24914

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

From: Chris Oesterling <chris@angus.mystery.com>
I just purchased a KLM 16C (I think) 2 meter OSCAR antenna and had
a question about where to attached the feedline. I have a seperated
Yaseu 5400B rotor on my Rohn 45G tower. (The az rotor is in the
tower and elv rotor is attached to the mast connected to the az
rotor.) The feedling attaches to the back end of the KLM antenna.
So do I attached the feedline from the antenna to to boom then to the
tower or the antenna to mast to tower or what? I feel a little silly
asking such a simple question but I really what to minimize my time
at the top of the tower! Thanks - Chris N8UDK

I was not as explicit as I should have been. I am referring to all the hams who use amateur radio satellites. Many of these people have no Internet EMail accounts. It would be of service to them for a node to forward Internet EMail messages to and from the satellites.

If I didn't make it clear enough this time reply and I will try again.

1108. Satellite Tracking by Feedback

Newsgroup: rec.radio.amateur.space
Date: 1995-05-22 00:00:00 UTC
From: g7uph@cromer.demon.co.uk
Message-ID: <19950522.011849.93@cromer.demon.co.uk>
Source record: 25008

I am a newby, so please excuse me if this is a naive question:

Has anyone built a system that will 'lock on' to a satellite by feedback after it has been pointed at it, rather than relying on prediction alone? Or are there commercial systems which do this?

There may be other ways, but it seems to me this should be possible to do this without ancilliary antennas. These are my thoughts so far:

(The method relies on the assumption that the rx signal is strong enough when the antenna is pointing slightly off-line).

First consider elevation angle, on the assumption that azimuth is being maintained correct. When the rx antenna is pointing slightly off-line and lower than the true direction, the signal-strength will increase if the satellite elevation decreases, and will weaken if it increases.

I figured that it should be possible to use this information to operate the motor to maintain the rx antenna slightly off-line to the true direction. However, I foresaw various problems - one being that the antenna direction might happen to get on the 'wrong side' of the satellite direction. Possibly, suitable software could reverse the relation between the signal strength and the motor control signals when this happens.

However the major problem comes in when you want to control both azimuth and elevation, ie, deciding which of the two motors should be operated when the signal strength changes. The only way I can think of is to have a mechanism that would make the rx antenna array continuously 'gyrate', ie, moving its pointing-direction in a circle (ie, a cone).

In this scheme the aim would be to maintain the axis of the cone pointing at the satellite, so the angle of this conical motion to its own axis would be the off-line angle that one had decided should give an adequate signal, as well as a suitable sloping-off of signal-strength for control purposes (based on the known lobe shape of a the particular rx antenna being used).

This is how it works: when the axis of the cone of the gyrating motion is pointing exactly at the satellite, the signal strength will be constant. (Or to be more accurate, in case the lobe is not circularly symmetrical, the signal-strength should be the same at '12-oclock' as at '6-oclock' and the same at '9-oclock' as at '3-oclock'). However, when the satellite moves off line to the axis of the cone of this will change.

If the signal is stronger at '12-oclock' than at '6-oclock', then the elevation must be raised; if stronger at '3-oclock' than at '9-oclock', then the azimuth must swing to the right; etc.

Now, just as I was thinking that a gyrating mechanism added to two rotators, was beginning to look far too complicated, it dawned on me that one ordinary motor, and four brakes might be made to do the whole job (and overcome certain directly-overhead problems). By applying brakes at the right times, in the gyration cycle perhaps both azimuth and elevation might be controlled. However I'm still not home and dry, because I envisage problems with wind.

I would be interested to hear from anyone who has had any thoughts on this, or other ways, of 'locking on' to a satellite - or indeed, from anyone who thinks it is fundamentally unworkable (perhaps, because of the periodic rx signal-strength fluctuation produced by the gyratory motion?)

I forgot to mention that the tx antenna would point in the same direction as the axis of the cone, and therefore always point more accurately than the rx.

Yup. Reminds me a lot of the local citizens in my neighborhood.
They are doing their best to clean up the neighborhood: no outdoor
antennas of any nature are allowed. That's what the majority wants,
and that's exactly what they got.

Seems to me there are two kinds of people: those who think everything
not specifically permitted is forbidden, and those who think everything
not specifically forbidden is permitted.

I have no time for folks who fall into the first group.

To put it bluntly: STOP TELLING ME WHAT I AM ALLOWED TO READ.

Thank you for your consideration.

Also thank you for your consideration in removing at least 4 or 5
of the 6 or 7 groups this has been posted to. "Spam by any other
name tastes just as bad."

And when these newgroups get even more noisy due to self-interested businesses posting hundreds or thousands of ads, will you still be reading netnews?

I think netnews is, in economic terms, a "public good". There is very little direct cost in posting an ad; moreover, once someone posts an ad, it is to one's advantage to join in before the resource is ruined - to "beat the curve". So it eventually becomes polluted with advertisements, diluting the information content below the point where it is worthwhile to bother trying to find the gems.

It's rather like clean air and water; there's little direct cost to polluting, and there is benefit in having such "cheap" waste disposal, so the market forces drive business to pollute. However, the total social cost is enormous.

Please don't pollute cyberspace. Keep ads in rec.radio.swap.

I could use advice on setting up a Satellite station for OSCARS (primarily PACSATS AND KITSATS).

Here is my plan:

RADIO NOW: ICOM 281H 2M RX/TX 50W 440 RX 9.6 ready

RADIO PLANNED: Plan to move to ICOM 820 or YAESU 736 this summer which would you suggest - I already have an ICOM 737 with ICOM computer interface so I would like to stick with ICOM if possible.

TNC: PK-900
WILL BUY: Either TAPR G3RUH 9.6 modem (limited to KITSATS ONLY) or the DSP-93

ANTENNA: Don't want to skimp but I live in a restricted neighborhood so I am limited to the 20' X 7' high attic space I have.

WAS thinking about the LOG LOG PERIODIC featured in the latest issue (OVERSIPLIFIED I UNDERSTAND) of QST. I would point 22 degrees up and spin on axis with a rotor. Where can I get on of these guys.

WAS thinking about a dual band EGGBEATER. I have read that these perform well in this application. Again, where can I get on of these guys.

Will need a 440 preamp - What do you suggest.

Will FEED the whole thing 50' to my shack in the basement with RG/8 coax.

WISP is my program of choice for the software part of this project.

Please any help would be appreciated. As you can see I am trying to step into this lightly because I am not sure if I will be able to use the sats from my site. I am able to hit MIR on just about every pass, that's easy I know.

At this point I would not mind trying a minimal setup just to see if I can hear the birds and go from there with better radios, rotators etc.

Any advice would be great. Thanks in advance.

1116. Help with Data General 1 Laptop

Newsgroup: rec.radio.amateur.space
Date: 1995-05-23 00:00:00 UTC
From: an275@FreeNet.Carleton.CA
Message-ID: <D90I3K.Jq5@freenet.carleton.ca>
Source record: 24920

I need a manual for the Data General 1. If you have any
ideas on this laptop and its operation please let me know.
I know its a boat anchor but the box of them were free and I
want to use it in the camper with a packet radio.

Thanks
Beau Bushor.....N1MJD

I don't see anything wrong with posting the data the way it was. Noone is
forcing you to read it. It is also more effecient this way since no more
e-mailing is required to obtain the data. As far as your reply is
concerned, I believe it to be a total waste of bandwidth.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

1122. Interface for DSP-2232 Icom 765 Yaesu 736r

Newsgroup: rec.radio.amateur.space
Date: 1995-05-24 00:00:00 UTC
From: Jean-Francois Tanguy <tanguy@CAM.ORG>
Message-ID: <3pvhqa$8o1@Tandem.CAM.ORG>
Source record: 24926

Hi , Salut

I buy the dsp-2232 for my satellites station, and I need some informations.

The dsp-2232 will be connected to a Icom-765 hf and a Yaesu FT-736-R.

For the Icom, my 765 as 100mv rms input, and 100-300 mv rms output, so it
is ok for the input, but for the output, it look like I will be short of
output for weak signal, and cw. Also I would like to have a threshold
adjustement for cw.
Did you designe a circuit to boost the signal from the Icom 765?

The Yaesu, for the data pin in/out jack, the input is 30mv rms at 600 ohm,
and output is 200 mv rms at 10 kohm, it is looking ok for the data jack for
1200 afsk.

But I would like to use the rig for 1200 and 9600 bauds, and in the
modifications for 9600 from G3RUH, I need 800mv p,p of output from the dsp,
and I do not have the output from the discriminator.
Also, it's look like I need differrents adjustement for 1200 and 9600 bauds.
How can I use the direct discriminator and varactor connection of the Yaesu,
to run both 1200 and 9600 without playing with the adjustement of the dsp?

I know there is someone there who have the same setup, and solve the problems
I badly need plans for a interface to connect my radios to the dsp-2232, I
already try with AEA, and they never answer to my specifique question, or
send me plans, they only suggest to play around the r203 and r206 for
more transmit audio, without more infos.

Thank you.

Hi Martin, I am assuming that you are referring to the PACSAT type of amateur radio satellites and that you hold an amateur radio callsign.

There are currently two ways for the AX25 type of mail to get onto a satellite. One is via a SATGATE but this is for BBS to BBS only and not for a satellite user directly and secondly via a SATNODE. Satnodes are designed for PACSAT users to send / receive messages to the packet network. So if you can get your E-mail through an Internet to packet gateway (there are a few in the USA) and direct it to a SATNODE then you will get your message onto a PACSAT. A PACSAT user can then use the reverse route to get mail back to you.

I do not have a list of SATNODES but maybe a message to this newsgroup or to the amsat-bb mailing list will bring this info.

NOTE: International regulations govering 3rd party messages vary ENORMOUSLY. Beware who you are trying to contact.

Hi
I am looking for plans for a interface between the 736 and the 2232 from AEA.
I look on compuserve, and send a lots of packets on radio, and no luck.

Also If you are using the Icom 765 with the dsp-2232, do you need some amplification from the radio to drive the dsp ?

Thank you best 73 de Jean-F VE2KAD

Hey Gary, me again - I was looking at the MIR Atenna thread and saw you mention that you built a Lindenblad. I am considering sticking this or a eggbeater up in my attic (HOA antenna restrictions) to work the PACSATS. Can you steer me in the direction of the plans for the above antennas - you also said that you built one - I would be interested in your experiences.

Thanks.
